CHAPTER

01

FOUNDATION

Imagine you are standing on a high plateau. A wide landscape stretches out before you, and in every direction run paths that were worn down long ago: the broad road of capitalism, the beaten track of socialism, the winding mosaic paths of democracy, the stony marching routes of the autocracies. Each of these paths bears the footprints of whole generations, and each has its own history. And each of them, if you look closely, ends at the same wall.

We sense this wall even when we do not name it. We sense it in climate reports that come faster and faster, in burning forests and overheated seas. We see it in the gap between rich and poor that widens with every crisis, and in the invisible people for whom the world of work no longer has a place. We experience it in democracies that waver and in autocracies that grow stronger because trust has fallen apart. And we smell it in the digital fog of endless notifications, in algorithms that devour our time, steer our thoughts, and let our humanity fray.

This book is an attempt to draw a path that does not end at this wall. It is called SOLIS, and it is not a party programme, not a religion, and not a state. It is the design for a social order that can withstand the conditions of this century: an order that remains just even when the people in it are fallible, that emerges strengthened from crises, and that can correct itself. Before the design begins, it must be clear why it is needed.

THE DEAD END OF THE ESTABLISHED ORDERS

In the course of its history, humanity has produced several great designs for order, and each of them achieved something real.

Capitalism released prosperity and inventiveness on an unprecedented scale. At the same time, it plundered the natural foundations of life and divided societies. Socialism took the promise of equality seriously and, in the form it actually took, stifled freedom and the spirit of invention. Democracy gave people a voice, and it reaches its limit where many voices turn into a noise without direction that lacks the mechanisms of self-correction. Autocracy demonstrated resolve and order, at the expense of dignity and of the creative power without which no society stays alive.

None of these designs is simply wrong. Each has reached an inner limit that it cannot cross by its own logic. And these limits stand out so sharply today because the conditions under which those orders arose have shifted fundamentally. The great challenges of the present are no longer national, no longer separate from one another, and no longer slow. Climate change, the concentration of wealth, the upheaval brought by digital technology, and the erosion of a shared relation to truth are interlocked. They reinforce one another and unfold faster than established institutions can process them. An order built for a slower and more bounded world can no longer reliably steer a connected and accelerated one. We are not dealing with a broken cog that could be replaced. We are dealing with a machine whose design no longer fits the conditions.

Against this background, SOLIS does not see itself as one more ideology. It is the answer to a sober analysis of what is missing, and this answer can be traced back to four necessities.

First, we need an order that brings people, the planet, and technology into balance instead of subordinating one to another: neither humans above nature, nor the machine above humans, nor the economy above everything. Second, we need an order that does not maximize short-term profit but is aimed at durability, resilience, and shared well-being. Growth that consumes the foundations of its own possibility is not progress. Third, we need an order that promotes invention without sacrificing its ethical limits. It places the most powerful tools of the present, from artificial intelligence to genetic engineering, in the service of people instead of delivering people up to them. Fourth, we need an order that brings competence and conscience together, not through coercion, money, or the accumulation of power, but through meaning and a shared direction. The deepest upheavals of history were never merely technical. They were always cultural and ethical movements as well.

The objection is obvious that such a design is utopian. Yet it does not rest on the assumption of a better humanity. It rests on the insight that carrying on as before is the real improbability. In a world whose ecological, technological, and geopolitical fate is shared, extending the status quo is not the safe option but the riskiest of all. SOLIS builds on the resilient elements of human experience, on inventiveness, ethical depth, and the ability to think beyond what is immediately one's own, and joins them into an order that holds.

HUMANITY AT THE CROSSROADS

Never before has humanity had so much power over its own fate. We can alter genes, leave the planet, turn the world into a single conversation, and use or destroy resources on a scale that was unthinkable only a few decades ago. And never before have we stood so close to the abyss, because what we gained in power we did not develop alongside it in wisdom, care, and public spirit. That the established orders are reaching their limits is therefore no abstract diagnosis. It shows itself in several simultaneous crises, each of which weighs heavily on its own and which only together, in their coupling, make up the real picture.

The ecological crisis is the most fundamental, because it concerns the material precondition of every society. An economy that consumes resources faster than they renew and treats the stability of the climate as a free dowry undermines the conditions of its own survival. No prosperity and no progress can be secured for long on a destabilized planet. The social crisis shows itself in a concentration of wealth and opportunity that hollows out the cohesion of societies. Where the gap between participation and exclusion opens too wide, the promise of equality before the law loses its tangible basis, and with it the trust that carries every order. The technological crisis is of its own kind, because it changes not only the means but people themselves. Digital systems today determine what people perceive, how they judge, and where they direct their attention. Where these systems serve only the exploitation of attention, a silent steering arises that escapes conscious control.

The political crisis follows from the others. Where institutions can no longer cope with the problems, trust dwindles. Where trust dwindles, simple answers gain power, answers that do not solve difficult situations but cover them up. Stable democracies begin to waver, and authoritarian models gain appeal because they promise the capacity to act. The crisis of meaning, finally, is the least visible and yet has the deepest effect. An order that addresses people above all as consumers, labour, and data points leaves a question unanswered that cannot be silenced: what all of this is for. We no longer know what is enough, what is good, and what “we” means. Consumption replaces meaning, distraction replaces engagement, efficiency replaces humanity. Without sound answers to the question of meaning, the inner hold from which societies draw their resilience falls apart.

These crises cannot be solved one at a time or one after another, because they condition one another. This is precisely the reason for a design cast from a single mould: an order that treats ecology, the economy, law, education, culture, and technology as separate departments will fail at the interfaces, where the real problems lie. SOLIS therefore does not start from a single reform, but from the connections between them.

THE FIVE ETHICAL FOUNDATIONS

Every lasting order needs a foundation that lies deeper than its laws, its technology, and its institutions, because these change while the foundation has to bear the load. It is made not of

concrete, not of money, and not of power, but of values. In SOLIS there are five foundations. They are introduced here not as a creed but as working principles: each of them rules out certain orders and brings certain institutional consequences with it.

◆ THE DIGNITY OF THE HUMAN BEING

At the centre stands the human being as a value in themselves, not as a means: regardless of origin, sex, age, conviction, or ability to perform. It does not follow that all people are the same, but it does follow that they are equal in worth. An order that takes this principle seriously may not divide people into useful and useless ones and may not drop anyone because they are considered unproductive. A ninety-year-old woman with dementia is not a burden. She is part of the community, with a right to care. A refugee is not a cost factor. He is a person with a history, pain, and hope. The institutional consequence is a basic provision that does not depend on a person's employment record, and a law that protects the weak as well as the strong.

◆ THE BALANCE OF INDIVIDUAL AND COMMUNITY

The human being is neither an isolated lone fighter nor a mere element of the collective. They are a social individual who needs freedom in order to grow and community in order to flourish. The freedom of the individual ends where it destroys the good of the community. The good of the community may not be defined in a way that crushes the dignity of the individual. This balance is not a state but a living dance that has to be recalibrated again and again. It requires institutions that carry out exactly this weighing instead of deciding it one-sidedly. An enterprise may

not circumvent environmental standards to earn more in the short term, because that harms the community. But neither may the community decide over people's heads what is good for everyone, without participation, dialogue, and respect.

◆ RESPONSIBILITY FOR THE PLANET

The Earth is neither a backdrop nor a store of raw materials. It is the living world on which every society depends: a living system that we do not rule but to which we belong. From this follows the commitment to a use that allows renewal, to the greatest caution in interventions in ecosystems, and to the protection of the natural foundations as a core task rather than a side issue. This principle is not a moral add-on but a condition of survival: no system, no prosperity, and no progress can endure on a dying planet. It explains why the natural foundations in SOLIS are withdrawn from private appropriation and why the living world receives a voice of its own in the decisions of the order.

◆ THE ADVANCEMENT OF KNOWLEDGE AND WISDOM

SOLIS bases its decisions not on power, money, or ideology, but on the best available knowledge, joined with ethical judgment. Knowledge without ethics can be destructive, and power without knowledge is blind. Only their combination holds. From this follows the commitment to ongoing research, to the testability of assumptions, and to open access to knowledge. And from this follows the insight that cleverness alone is not enough. It takes the foresight that considers consequences across generations, and the humility to hold one's own error possible. Together, we call these two wisdom.

◆ LONG-TERM RESILIENCE

The worth of an order proves itself not in calm times but in crisis. SOLIS is therefore built for resilience. It is able to learn, because it can correct itself. It is strong, because it is organized in a decentralized way. And it is adaptable, because it takes feedback seriously. A health system that survives an epidemic without collapsing. An energy grid that absorbs the failure of one part with the others. A public sphere that recognizes a lie before it takes effect. That is what resilience looks like. In a future shaped by ecological, geopolitical, and technological uncertainty, this order is meant not merely to survive. It is meant to emerge from strain stronger than before.

These five foundations form the standard against which every following chapter can be measured. They are the compass that aligns individual decisions, and at the same time the condition for many individual rules becoming an order rather than a patchwork. And they are more than rules for institutions. They are also an attitude that people can grow into: respect for all life, truthfulness in word and deed, responsibility for one's own actions, protection of the weak, and the recognition of the other's freedom as the condition of one's own. We are not building a house of cards. We are building a foundation that is meant to hold in a hundred and in five hundred years: a living system that can grow, learn, fail, renew itself, and rise again and again.

THE NARROW CORE AND THE WIDE FREEDOM

One misunderstanding needs to be cleared up from the start. That SOLIS rests on five non-negotiable foundations does not mean that it prescribes to people what their good life consists of. The foundations are a narrow, firm core. Above it lies a great freedom. What meaning, happiness, and fulfilment are, and which paths lead to them, is decided not by the order but by each person and each community for themselves. An order that laid this down as well would no longer be a framework but a worldview that raises itself to law. SOLIS therefore strictly separates what applies to everyone from what belongs to each person: a narrow ground of the non-negotiable and, above it, the breadth of difference. This separation recurs throughout the whole work, from culture to the world order, and it is the reason why SOLIS does not fear diversity but needs it.

METHOD AND STRUCTURE OF THE WORK

The ambition of this work calls for a particular method, and it makes sense to disclose it before the individual areas are unfolded.

The first commitment is the link between principle and institution. A value that is not translated into a verifiable rule, a procedure, or an institution remains without consequence. This work is

therefore not content with describing desirable conditions. As far as it can, it names the mechanisms through which they last, also and especially in case individual participants try to exploit the order. Wherever a principle is introduced, one must therefore always ask how it is secured. The second commitment is the application of the order to itself. The hardest question for any social order is not how it governs its citizens, but how it limits its own power. SOLIS does not answer it with a supreme supervisory body that would itself remain unsupervised. It applies the same principles to its own institutions: transparency, separation of powers, accountability to the citizenry, protection against capture. This idea carries the chapter on the order of power and recurs throughout the whole work. The third commitment is honesty about the design itself. Where a solution is only an approximation, the work says so. Where a path can fail, it names the danger.

On this basis, the structure unfolds. This first chapter lays the ethical foundation. The second sets out the order of power: fundamental rights, the Ring of institutions, and the public sphere. The third deals with law, the fourth with security, defence, and peace, the fifth with the economy and resources, the sixth with the planet. Then come education and knowledge, health and well-being, culture and meaning, and technology, artificial intelligence, and humanity's place in the larger scheme of things. The eleventh chapter is devoted to children and families as the foundation on which every lasting change rests, the twelfth to the path from what exists to this order, the thirteenth to the relationship of SOLIS to the world. A final chapter sums up the foundations and building blocks and looks ahead.

A woman named Mara also walks through chapters two to thirteen. She is invented, and so is the town by the river where she

lives. But everything that happens to her is exactly what this book designs. That is why she stands at the beginning of every chapter: so that the order is not only understood but seen.

The areas build on one another, but each can also be understood on its own, so that the work can be read from beginning to end or explored selectively. Not everyone thinks in the same order: some come by way of the environment, some by way of education, some by way of the question of meaning. The work is therefore a web, not a scaffold, and yet in the end it forms a single picture. It is not a text meant to reassure. It is a design meant to be argued with, written for all who believe that something other than the administration of what exists is possible: a fundamentally different and at the same time robust order.

SOCIETY AND THE ORDER OF POWER

The letter came on a Tuesday. Mara, forty-one, a hydraulic engineer at the enterprise for river and banks, had been drawn by lot into the regional assembly for one year. She had never wanted an office, and she would have been allowed to decline. On the first day of the session she sat between an elected farmer and a cook who had been drawn by lot, and in front of them lay the region's budget, open to anyone who wanted to read it. "You don't need to know anything," said the cook, who was already in her second year. "You only need to ask until you understand. That is what we are here for."

FUNDAMENTAL RIGHTS AND THE WEIGHING BETWEEN THEM

At the centre of SOLIS stands a double promise: you are free, and you are protected, part of a community that neither crushes you nor leaves you alone. That sounds self-evident, and yet existing orders often fail at exactly this point. They guarantee rights that are complete on paper and remain empty in real life: a right to education where the schools are crumbling, a right to health that depends on wealth, a freedom of expression that is silenced by economic or algorithmic power. SOLIS draws a fundamental conclusion from this: rights are only as strong as their practical safeguards. It is not enough to proclaim them. They must be tangible, measurable, and enforceable in everyday life.

The fundamental rights that SOLIS guarantees include the right to life and to physical and mental integrity, freedom of opinion, belief, and conscience, and freedom of movement, of assembly, and of the choice of education and occupation. To these is added secure access to the material foundations of a dignified life: water, food, housing, energy, education, health, and participation. This last guarantee is not a charity but the condition of all the other freedoms. There is no freedom in starving, and no freedom in dying of a treatable illness because the means are lacking. Beyond human beings, SOLIS recognizes a claim to protection of the natural world in its own right. How this claim takes effect is set out in the chapter on the planet.

So that these rights do not remain abstract, they are anchored in procedures and institutions, and their actual state is recorded continuously. Monitoring fundamental rights is a task of the independent transparency and review body that this chapter will introduce. It regularly measures how things stand with people's real freedom and dignity, not in the statute books but in everyday life. Where it turns out that certain groups are systematically disadvantaged, targeted programmes are triggered to reduce the inequality. Guaranteeing a right thus includes the duty to check that it is honoured.

◆ THE ABSOLUTE FLOOR AND THE PROCEDURE OF WEIGHING

The hardest case is not the violation of a single right but the conflict of two rights with each other. Here it is not enough to point to wise judgment in the situation, because that shifts the real decision into the discretion of those who make it. SOLIS replaces this discretion with a procedure that has fixed limits. First comes an absolute floor: human dignity and physical and mental integrity cannot be weighed. They form a threshold below which no good is traded off against another. No argument from the common good and no gain in efficiency justifies violating them.

Above this threshold, conflicts are decided by a regulated standard of proportionality. Whoever wants to restrict a right bears the burden of justification, not the person whose right is to be restricted. The mildest effective means must always be chosen. The decision must be justified in public, is subject to review by the ethics councils and the courts, and is documented as a precedent, so that like cases are treated alike in future. Weighing thus

becomes a traceable procedure with a fixed floor, a clear burden of proof, and the possibility of review, and not a matter of goodwill.

THE ORDER OF POWER: THE RING

There is a problem that recurs in the history of every form of rule: power tends to preserve itself, to strengthen itself, and to protect itself. It attracts money, influence, and networks of cronies. It forms closed circles in which interests cover for one another. In the end, the integrity of institutions suffers, as do the trust of citizens and the ability of society to act for the long term. An order that does not solve this problem but merely moves it elsewhere is not viable.

◆ WHY THE RULE OF THE WISE FAILS

The obvious answer is to put the cleverest and most upright at the top, selected through a careful procedure that tests for wisdom, achievement in life, and strength of character. This answer is seductive, and history has refuted it. Plato's philosopher kings, the Chinese mandarinates, the Leninist vanguard: each of these designs began with the promise of selecting the best and ended in the concentration of power. The reason does not lie in the failure of individual people. It lies in a structural weakness: wisdom and integrity cannot be measured objectively. Where an order makes them the criterion of selection, the selection procedure itself becomes the most valuable good and thus the target of capture. Whoever controls the filter controls the system. The

demand “we will simply select good people” therefore does not solve the problem of power. It moves it to a place that is harder to control.

SOLIS draws a clear conclusion from this: a nicer description of the governing body is not enough. In its place must come a hard mechanism that resists the very dynamic the order itself names. This mechanism is that there is no top.

◆ THE RING INSTEAD OF THE TOP

In SOLIS there is at the top neither a president nor a monarch, neither a party nor a computer. Power is not built as a pyramid but as a ring: a circle of bodies that check one another and none of which is the final authority. Whoever is bound into this circle is called “ringed” in this work, a new word for a new condition: bound in, bound to one another, with no way out at the top.

The assemblies are the place where the rules are made. At every level of the order, in the neighbourhood, the region, and the country, they debate and pass the laws and budgets of their area. They have a mixed membership: partly elected people, who answer for their proposals and their disclosed ties, and partly citizens chosen by lot. The elected part brings programmes and responsibility. The part chosen by lot brings society in its full breadth into the chamber and breaks the cartels that form around every election. No group can move the assembly on its own, because it can neither buy nor win in advance the part that the lot fills.

The offices held for a term carry out what the assemblies decide: they administer, build, supply, and organize. Their heads are appointed by suitability in an open procedure, serve for a limited

term, rotate, and give account. No office belongs to a person. Each is lent to them and taken back again.

The Council of the Wise is one of these bodies, but not their summit. Its task is long-term orientation across disciplines, thinking beyond the horizon of the day's questions, which supplies the other bodies with drafts and assessments. It advises, drafts, and warns. It does not command and does not decide alone. Its strength lies in judgment, not in control.

The ethics councils act at every level as reviewers of the foundations. They examine planned laws and far-reaching decisions not only for legal and economic coherence but for their compatibility with the five foundations. Their members come from many fields, from science, philosophy, the arts, care work, the crafts, and the groups that are otherwise not heard, and they have a strong right of review and a suspensive veto. They can halt developments that fundamentally contradict the values of the order and return the matter to the assembly and the citizenry. They thus have influence, not unlimited power.

The courts apply the law bindingly and equally to everyone. What is decisive is that they also apply it to the other bodies of the Ring. No office and no institution stands above the law.

The transparency and review body, finally, secures the foundation without which the Ring cannot work: open access to information. It ensures that decisions, flows of money, and conflicts of interest can be traced, it monitors the state of fundamental rights, and it prevents any body from blinding the others by holding knowledge alone.

These bodies check one another in a circle. The assembly decides, but the ethics councils can halt. The office carries out, but the courts bind it. The Council of the Wise drafts, but it does

not decide. The review body sees everything, but it commands nothing. None can act without the others, none stands above the others, and there is no point at which the chain of control ends. This is precisely the break with the pyramid: where there is no top, there is also no highest target for capture.

◆ THE LEVELS AND SUBSIDIARITY

The Ring is not one but many. The order is built in levels, from the neighbourhood through the town and the region to the country and up to the planetary level, which the chapter on the world order deals with. Each level is itself a ring with an assembly, offices, an ethics council, courts, and a review body. Between the levels, subsidiarity applies in its strict form: the higher level may do only what the lower one truly cannot. Decisions are made as close as possible to people and to the matter at hand, and power flows from the bottom up, not the other way round. A playground belongs to the neighbourhood, a waterworks to the region, a climate target to the union of countries.

◆ THE CITIZENRY AS THE OUTER ANCHOR

A ring that turned only within itself would remain a closed system. That is why the Ring is anchored below in the people. The citizenry is the one node that sits outside the institutional circle, and it holds the constituent power: it can recall the bodies of the Ring, overrule them, and fill them anew. The members of the Council of the Wise and of the other bodies serve on a revocable mandate. Their authority is lent, not owned. In SOLIS, power is not a prize but a loan.

What the citizenry decides itself and what it leaves to the assemblies is precisely defined, so that neither gets out of hand. Four things belong directly to the citizenry: the adoption of the order itself, any change to its core, the recall and refilling of its bodies, and the questions that an assembly puts before it or that a petition with sufficient support brings to it. Everything else, laws, budgets, projects, and the everyday business of the order, is decided by the assemblies, in which the citizenry sits anyway through the lot. Thus the power of the people remains the root, without every water pipe becoming a referendum.

Here, however, lies a danger that SOLIS expressly avoids. Pure, direct majority power would bring back exactly the forces that the order rejects from the start: populism, manipulation, echo chambers, the babble of voices without direction. SOLIS already carries the answer within itself. The power of the citizenry is not exercised as a raw vote but structured by the deliberative participation system: informed, based on facts, and secured against manipulation. Before every decision by the citizenry, citizens receive checked and diverse information, access to expert forums, and aids to ethical deliberation. Only on this basis is the decision made. Thus the power of the people remains the root of legitimacy without tipping over into populism.

This brings together what does not hold when kept apart. Power is a ring without a top, the ring is grounded in the people, and the power of the people is filtered through deliberation. This is the application of the order to itself: SOLIS governs itself by the same principles by which it lets society govern itself.

◆ THE MECHANICS AGAINST CAPTURE

So that this remains a mechanism and not a mere principle, the Ring rests on four concrete components.

The first is sortition. Part of the assemblies and of the supervisory bodies is neither elected nor appointed but filled on a rotating basis by lot from the citizenry, following the model of the ancient *boule* and the jury. A lot cannot be bribed in advance. No career can be built on a lot. No stable cartel can form out of the lot. It is the incorruptible element of the system.

The second is compulsory rotation with term limits. Power passes through hands instead of settling in them. Where no one stays in one place long enough to make it their own, nothing hardens.

The third is the right of recall and reconstitution. The Council of the Wise and every other body can be dissolved and filled anew by a structured, informed majority of the citizenry. The guardians serve as long as their mandate holds, and no longer.

The fourth is the separation of control over information from the power of decision. No body may both determine what is known and decide what is done. The transparency and review body ensures that the base of knowledge is shared and open, so that no node can dominate the others through a monopoly on information.

◆ THE LOT AND EXPERTISE

The objection is obvious: how is a citizen chosen at random supposed to judge things they do not understand? The answer lies in the task that the lot performs. It fills not the expert task but the task of control. No one is chosen by lot to run a power station or

to lead an operation. Those chosen by lot are the ones who check whether the operators and leaders act honestly, proportionately, and in the spirit of the foundations. That requires not a specialist degree but judgment, time, and good information. The last of these is provided by the review body, which assigns to every body chosen by lot experts of different schools who are allowed to contradict one another. Whoever is drawn is released from work for the duration of their service, and the service counts as a contribution. Whoever cannot or will not serve may decline. A lot that compelled would lose its dignity. Thus chance does not turn into amateurism but into what it has been in the jury for centuries: the incorruptible eye of the community.

◆ THE SELECTION OF THE COUNCIL OF THE WISE

From these components also follows the answer to the question on which the rule of the wise fails: how the Council of the Wise is filled without a hidden filter for wisdom becoming the object of capture.

SOLIS does without a body that decides on the wisdom of the candidates in a closed procedure. In its place comes a multi-stage, open procedure. Candidates are proposed widely and examined in public, against disclosed and contestable standards: demonstrable judgment, achievement in life, and proven capacity for responsibility, not an opaque score for “wisdom”. The decisive role in this procedure is played by a citizens’ panel chosen by lot, which itself changes and therefore cannot be bought in advance. The final constituent power and the right of recall remain with the citizenry. Terms of office are limited, and mandates are revocable.

Wisdom is thus not certified once and for all. The Council remains accountable and replaceable at all times.

◆ DECIDING UNDER TIME PRESSURE

Deliberation takes time, and not every situation allows it. An epidemic, a dam breach, an attack on the power grid demand decisions within hours, not months. Here lurks the temptation of every order to create, in the name of necessity, an authority that stands above the rules, and history shows that such authority is rarely given back. SOLIS therefore builds the exception so that it ends itself. Emergency powers are possible, but they are narrowly defined, public, time-limited, and given an expiry date that is not extended without a new decision of the assembly. A body chosen partly by lot reviews every measure afterwards, and everything that was built up in the emergency is subject to the duty to dismantle it. The order can be fast without losing itself, because the speed has an end that is fixed at the beginning. How these stages look in detail is described in the chapter on security.

◆ AN ORDER THAT HOLDS WITH FALLIBLE PEOPLE

The decisive test of an order of power is not whether it works with good people, but whether it remains just with fallible, self-interested people. The Ring is built on this assumption. It does not require office holders to be wise and selfless. It requires only that no one can entrench themselves permanently. A circle without a top, whose bodies are partly chosen by lot, rotate, can be recalled, and are subject to open information, remains correctable even when individuals try to exploit it. At the same time, each individual remains responsible: whoever decides does so under

their own name, with a public justification, and before the courts, which bind them like anyone else. SOLIS thus does not solve the question of power by hoping for better people. It solves it through a structure that withstands the human temptation to power, and precisely this distinguishes a robust design from a mere vision.

THE PUBLIC SPHERE, THE MEDIA, AND THE QUESTION OF WHO DEFINES REALITY

Where societies fall apart, the collapse is regularly preceded by a loss: the loss of a shared relation to reality. Without a functioning public sphere that is free and at the same time responsible, people no longer know what they can hold on to. Power elites determine the narratives without control, facts become weapons, and citizens lapse either into indifference or into fanaticism. SOLIS counters this with a media order that is not only free in the legal sense but ethically grounded, transparent, diverse, and accessible.

This order stands between two failures, and it avoids both. In authoritarian systems, media become tools of control. In systems driven purely by profit, they become machines for exploiting attention, which put ratings above substance and division above understanding, and in the digital public sphere, monopolies of opinion arise that use algorithms to decide what is perceived. SOLIS therefore knows neither state-controlled media nor a market that follows only the maximization of profit. Media organizations work according to a verifiable ethical code. Their ownership

structures, flows of money, and conflicts of interest must be disclosed, because independence arises only where media are free and at the same time bear a responsibility.

This raises the hardest question of every open society, and SOLIS does not avoid it. A free public sphere must be able to defend itself against deliberate disinformation and manipulation that undermine common decisions. Yet any authority able to determine what counts as false becomes itself the greatest danger, the gateway through which the creeping advance of authoritarianism has historically entered. The answer therefore cannot lie in a ministry of truth that rules on the true and the false, but only in a procedure.

This procedure rests on several commitments. There is no state pre-censorship. The standard response to false or harmful statements is counter-speech, context, and labelling, not removal. Where an intervention is nevertheless considered, it follows an adversarial procedure: a review panel filled partly by lot decides, the burden of proof lies with the claim that something is false or manipulative, the justification is public, and the decision can be appealed. Above everything stands an immovable limit: this procedure may never be directed against criticism of SOLIS itself, of its institutions, or of its office holders. Political dissent is categorically protected. It is precisely this limit that prevents the necessary defence against manipulation from becoming the tool for holding on to power.

Transparency applies not only to the media but equally to the bodies of the order and to the economy. Decisions, flows of money, and conflicts of interest must be open to inspection. Registers of lobbying are mandatory and public, and citizens have the right to know who influenced a decision, which data it was based

on, and which alternatives were examined. The digital platforms, finally, as the central arenas of today's conversation, are treated as part of democratic infrastructure and not as a purely private matter. Their algorithms must be disclosed and open to review, other voices must find fair access, and they too are subject to the limits on procedure and protection already named.

The deepest safeguard, however, lies not in a body that intervenes but in education. A population that has learned from an early age to check sources, compare perspectives, and recognize manipulation is the strongest defence against the distortion of the public sphere, and it makes any intervening authority as unnecessary as possible. The aim of the media order is therefore not the perfect control of information. The aim is a mature society that does not let itself be manipulated, judges critically and with confidence, can argue without destroying itself, and can listen without submitting.

◆ THE GUARDIANS AND THE MEASURING INSTRUMENTS

Particular vigilance is owed to the standards by which the order measures its own state. The protection of fundamental rights can be monitored, but every indicator that becomes a target loses its meaning over time: where a number decides on the well-being of the order, the temptation grows to serve the number instead of the matter. The hollowing out then happens not through open attack but silently, while the display goes on reporting health. SOLIS meets this in two ways. The standards themselves change, are set adversarially, and are deliberately called into question, and alongside measurable monitoring comes unpredictable review carried out by citizens, which cannot be

prepared for. Thus not only the guardians are watched, but the measuring instruments too.

HOW THE ORDER CHANGES

So that a learning order can change without losing itself, it needs a regulated way of changing its own rules. SOLIS distinguishes two levels for this. The core, that is, the five foundations, the fundamental rights, and the load-bearing safeguards against capture, is withdrawn from everyday politics: no assembly and no office can touch it. Only the citizenry itself can change it, and even then only under high hurdles: with a large majority, after thorough deliberation, with a time gap between decision and confirmation, and across more than one generation. Everything else moves more freely, through the assemblies and the deliberative participation system. This joins what fails when kept apart: the flexibility without which an order freezes, and the firmness without which it gives itself away.

◆ THE RIGHT TO LEAVE

The maturity that this work entrusts to the citizenry also includes the right not only to reject the order from within but to leave it. Whoever does not want to live under the five foundations is not forced to stay. The right to leave is itself a safeguard: an order that one may leave has to convince through what it achieves, and not by bolting the exit. How this right is arranged without

becoming a lever for destroying the community is dealt with in the chapter on the world order.

LAW AND JUSTICE

The dispute over the noise from the workshop below Mara's flat did not end in court. It ended at a kitchen table, with a mediator from the neighbourhood, a plan for working hours, and a door that the carpenter soundproofed. Two years later, Mara herself sat on a bench of judges, drawn by lot like the cook beside her. A man had set fire to a warehouse, out of rage, because his enterprise had passed him over. He was not locked away. He helped rebuild the warehouse, for a year, and he came to know the watchman who had almost died that night.

n order reveals its character not in those who follow it but in those who break it. Dealing with wrongdoing is therefore not a fringe area of law but its real test: it shows whether a society's principles still apply when they become inconvenient. In many existing systems, people experience the justice system as opaque and overly bureaucratic, as dependent on money and influence, and as geared to punishment instead of restoration. Proceedings drag on for years and in the end leave only losers. SOLIS does not answer the question of wrongdoing with the reflex of retribution. It answers with a law that protects, restores, and preserves the dignity even of the person who violated it.

THE DUAL STRUCTURE OF ETHICS AND LAW

A society is only as just as its law. Values set the direction. Without institutions that pronounce and enforce the law, they remain theory. SOLIS therefore joins ethics and law into a dual structure that is already laid out in the Ring: the ethics councils examine whether laws and far-reaching decisions are compatible with the five foundations and halt whatever contradicts them. The courts apply the rules bindingly and equally to everyone. One side asks whether a law is good, the other whether it is kept, and neither replaces the other. Laws serve to make the foundations concrete. They may never replace them and never bend them. The

result is an order that is not only formally correct but also morally grounded, and that places at its centre not power but balance.

A LAW THAT EVERYONE UNDERSTANDS

Law in SOLIS is accessible. It may not be a secret code that only experts can decipher. The essential rules, rights, and procedures are available in clear language, are taught in schools, and can be found digitally. Anyone who gets into a conflict can see without a long search which rights they have, which steps are open to them, and where they can find help. Legal assistance is guaranteed, regardless of wealth. Law in SOLIS is also transparent: no judgment is issued without a public justification, and no procedure without verifiable standards. Whoever judges discloses the criteria by which they decide, so that those involved can understand why something was decided, even if they do not like the result. For trust arises only where people know that they are not being judged by caprice or hidden interests.

THE LIMITS OF RETRIBUTION

The obvious answer to wrongdoing is retribution: whoever causes harm should suffer harm. It is old and understandable, and it falls short. The act that was repaid has still happened, the victim's

loss remains unhealed, and the person punished returns, burdened further by the hardship suffered, to the circumstances from which the act arose. An order that draws its security from punishment alone therefore produces not calm but repetition: overcrowded prisons, high rates of reoffending, and whole groups who shuttle between crime and prison. For SOLIS, a sober principle follows from this. Punishment is not an end but a means, and it is justified only by what it achieves.

RESTORATIVE JUSTICE

In place of retribution comes restorative justice. Its measure is not the suffering inflicted but the suffering healed, and it pursues three aims at once. First, redress for the victim: where harm can be made good, making it good takes priority, and the person harmed receives real compensation instead of a symbolic verdict. Second, the return of the offender: where an act arose from need, addiction, or illness, removing its cause is added to the sanction, because whoever leaves the cause untouched invites repetition. Third, the protection of others: deprivation of liberty remains the means for dealing with those who pose a serious danger. But it too serves safety and return, not revenge. Thus punishment is measured by its effect, not by its harshness.

Whoever causes harm is not simply locked away. They are drawn into a process that lets them understand the consequences of their actions and involves them in repairing them. A young person who causes damage to property is not branded but included

in a programme that understands them and lets them share in the repair. An enterprise that violates ecological standards does not merely pay a fine but contributes actively to restoration, together with experts and the communities affected. Repressive punishment often fights only symptoms. SOLIS aims at the causes, because that is where the lasting effect lies.

FAIR PROCEDURE AND EQUALITY BEFORE THE LAW

So that law does not turn into caprice, it rests on procedural guarantees that yield to no expediency: the presumption of innocence, the burden of proof on the prosecution, and the right to defence, to a hearing, and to independent review. Whoever is wrongly accused receives complete protection and assistance. What is decisive, however, is a principle that separates SOLIS from every justice of the rulers: the law applies equally to everyone, and it also applies to the bodies of the Ring. The courts apply the same standards to the Council of the Wise, the ethics councils, the assemblies, and every office holder as to every citizen. No office and no institution stands above the law. A law that spares the powerful is no longer law but a tool.

OPEN CASE LAW ON THE FOUNDATIONS

The five foundations form the non-negotiable core of the order. Their application in the individual case is not. What dignity requires when two dignities collide, or what responsibility for the planet demands against the freedom of the individual, is decided in interpretation, and interpretation is power. It follows that SOLIS does not leave it to a closed circle of interpreters. Case law on the foundations is open and adversarial. Hard cases are argued by representatives of the opposing sides before a bench filled partly by lot, every decision is justified in public and the dissenting opinion is published with it, and the precedent remains open to challenge. In the most fundamental questions, a citizens' panel chosen by lot takes part, so that the interpretation of the core stays anchored in the citizenry. Thus the foundations are immovable and their reading is nevertheless open to review. No one has the last word over them.

DISPUTES BETWEEN CITIZENS

Not every wrong is a crime. Most of it is conflict. Where an order forces every dispute straight into court, it turns people into opponents and courts into factories. Law in SOLIS is therefore tiered. At the start come mediation and dialogue, locally, quickly, and regardless of the wealth of those involved. Trained mediators

recognize tensions early and accompany the search for agreement. A dispute in the neighbourhood over noise, rubbish, or a misunderstanding between cultures is settled before it escalates into a complaint to the police. Only where agreement fails or rights are touched in principle does a court decide, and for questions that concern the order itself, a final instance. Even children learn to voice conflicts instead of suppressing them or fighting them out with violence. Thus law remains accessible, and disputes more often end in a workable solution than in a winner and a loser.

WHO ADMINISTERS JUSTICE

The system is carried by judges and mediators who do not rise by the logic of careers or power. They are appointed by suitability in an open procedure, undergo a thorough professional, ethical, and psychological examination, train continuously, and are regularly reviewed by the ethics councils and by bodies filled partly by lot. Their independence is protected: no office and no assembly can remove a judge because of a judgment. Yet they too do not sit in one place for life. They move between courts and levels, their presidencies are time-limited, and their work is reviewed in public. Citizens chosen by lot sit on the benches, so that law does not become the business of a caste but remains the judgment of the community. For a legal system is only as strong as the integrity, judgment, and empathy of those who apply it.

Above everything stands the principle that links law to the order of power: no one stands above the law, no office holder and

no institution, not the Council of the Wise and not the ethics councils. Law is thus not a tool of the powerful but a shield for the weak. There is no class justice in which wealth buys its way out, no opaque procedures without justification, and no law that only punishes instead of healing the causes.

THE LIMIT OF COERCION

Above everything stands a limit that even the guilty keep. No punishment may violate human dignity. There is no torture, no degrading treatment, and no punishment that excludes a person permanently from the community. Every sanction is proportionate, time-limited, open to review, and aimed at return. This limit is not a concession to leniency but a consequence of the foundation: dignity, which in the first foundation knows no condition, does not know the condition of guilt either.

SECURITY, DEFENCE, AND PEACE

On the night the river rose, the same sign lit up on every screen in the town: heightened alert, declared at ten past eleven, justified in three sentences, valid until Wednesday. Mara stood on the dyke with the Disaster Corps. Jonas, her husband, was carrying beds up to the top floor of the care home with his team. On Wednesday the water level fell, and the alert expired without anyone having to end it. Whatever powers the night had needed were gone again by Thursday, and a panel chosen by lot read the report.

n the end, every order rests on a question that many designs avoid: who controls force? Since Max Weber, the state has been defined as the entity that claims the monopoly of legitimate force. Whoever commands this monopoly, over the police, defence, and ultimate coercion, ultimately rules everything else, however carefully the other bodies are arranged. A Ring that distributes power but leaves force undivided would be a mere façade. Hence the principle of this chapter: security is not the exception to the order, but its strictest application.

WHO HOLDS THE SWORD

The temptation is to create, in the name of security, an authority that stands above the rules: in an emergency, to protect everyone, for a limited time. Historically, almost every freedom has died at this point, because emergency powers, once granted, are rarely given back. The power that was meant to weather the storm outlasts the storm. SOLIS concludes from this that there may be no place where force escapes control. The answer to the old question of who guards the guardians is, here too, not a higher guard. It is the same as everywhere else: a structure in which no one can entrench themselves.

THE RINGED APPARATUS OF FORCE

Four components bind force, just as four components bind political power. First, civilian oversight by bodies filled partly by lot: the armed bodies are watched not by their own kind but by the citizenry, and the leadership of the security forces stands under the assembly, not beside it. Second, the rotation of command and the time limits on office, so that no lasting cartel and no personal following forms around force. Third, the separation of command from execution and of ordering from review: whoever orders force may not at the same time rule on its lawfulness. Fourth, the complete traceability of every operation, every order, and every procurement. Weapons and equipment are procured in open procedures with open books, without hidden influence, and nothing that serves force comes into being in the dark.

Above these components stands an immovable limit: the force of the order may never be turned inwards against political dissent. Just as the intervention procedure of the media order may never be turned against criticism of SOLIS, the security apparatus may never be turned against those who oppose the order. This limit prevents the protection of the order from becoming the tool of its ossification.

INTERNAL SECURITY WITHOUT A POLICE STATE

In SOLIS, security at home does not come first from surveillance and deterrence, but from removing the causes of crime. Where no one is pushed into crime by need, exclusion, or a lack of prospects, crime falls before any patrol goes looking for it. Where protection is nevertheless needed, the principle of the mildest means applies: as little coercion as possible, and force only as a response to force. The security forces are part of the community, not its occupiers. They are trained in de-escalation as much as in intervention, and they are known where they serve. Here the asymmetric transparency that runs through the whole work applies. Full transparency applies to power, to every operation, every order, and every means, while the life of the individual is protected by privacy. SOLIS thus reverses the direction of surveillance: it is not the citizen who is exposed and the apparatus that is hidden, but the apparatus that is exposed and the citizen who is protected.

THE EXCEPTION THAT ENDS ITSELF

Even an order without a top must be able to act when an emergency leaves no time for deliberation. SOLIS therefore regulates the exception in advance, in a public model of stages that everyone knows. In the normal state, the ordinary rules apply.

Heightened alert permits exercises, the replenishing of stocks, and stronger protection of critical facilities. Partial mobilization opens shelters, calls up the reserve, and concentrates forces where the danger lies. Full mobilization, finally, permits evacuations, the redirection of resources, and the opening of aid corridors across borders. Each stage comes with clearly defined powers, is declared and justified in public, and carries an expiry date. Without a new decision of the assembly, it ends by itself.

What distinguishes the exception from emergency rule is the duty to dismantle. After every escalation, whatever it required is withdrawn: powers, collections of data, positions, stocks. A body filled partly by lot reviews every measure afterwards to see whether it was necessary and proportionate. Thus SOLIS can act within hours without the hours turning into years. The emergency receives what it needs and keeps none of it.

EXTERNAL DEFENCE WITHOUT ATTACK

Armed power has always been double-edged in history. It has offered protection and brought destruction, secured stability and stoked fear, defended peoples and unleashed wars. In conventional systems, the military often serves national interests, the projection of power, the securing of resources, and influence, and thereby leads to wars of aggression, arms races, and oppression at home. Towards the outside world, SOLIS therefore holds to a distinction that matters: attack is forbidden, defence is legitimate. SOLIS does not establish itself by force and subjugates no one.

And yet it is not obliged to let itself be destroyed in the name of tolerance. A society that has built something just may defend it without itself becoming the aggressor.

The doctrine is exclusively defensive. Defence protects the population from attacks, secures critical infrastructure, data, and supplies, and preserves ecosystems and resources. An attack on a power grid is repelled by cyber defence without SOLIS itself escalating. The system is organized in domains, cyberspace and the information space, air and space, land and sea, and civil protection, whose forces work together in a coordinated way. It is carried by a reserve that is trained in modules and pursues its ordinary occupations in everyday life. There are no attack missions, no machine that wages war on its own, and no weapon whose final decision over life does not lie in human hands. An artificial intelligence may detect and classify threats, but it may not make a lethal decision without human approval. The military leadership is always under civilian control and thus, like every power in SOLIS, under the oversight of the Ring and under the law.

Towards the outside world, SOLIS seeks a balance of caution: shared early warning systems, arms control, emergency protocols between the orders, and alliances with those who share its principles, so that a society that binds itself does not stand alone. A capacity for defence exists, sufficient to deter and bound so as not to become a threat itself. Thus SOLIS frees defence from the logic of attack and power projection: no arms race, no war of aggression, no deployment against its own population, but the protection of people and planet.

EARTH DEFENCE AND CIVIL PROTECTION

Not every danger wears a uniform. Earthquakes, floods, epidemics, technical accidents, solar storms that threaten the grid, and celestial bodies on a collision course hit people harder than most enemies, and they do not ask about borders. SOLIS therefore joins its protective structures with civilian tasks into an Earth Defence. Dedicated units, a Disaster Corps, are trained for high mobility and respond to natural disasters, epidemics, technical accidents, and threats from space. After an earthquake, they support evacuations, provide emergency power, and secure medical care. An asteroid detected early is deflected while civil protection prepares the evacuation.

Civil protection is built in a decentralized way, like everything in this order that must hold in an emergency: distributed stocks, shelters, emergency energy, connections secured several times over, and people who are trained instead of being patronized. Where the danger strikes all of humanity, the Earth Defence becomes part of the planetary defence that the chapter on the world order deals with. It is carried jointly and is itself ringed in turn, so that protection against the end never becomes a pretext for the rise of any single power.

PEACE AS ACTIVE WORK

The deepest protection, however, is not an apparatus but the absence of reasons for violence. In SOLIS, peace is not a pause between conflicts but continuous work: defusing tensions early, remedying injustices before they turn into violence, cultivating understanding across borders, and a diplomacy that does not begin only in a crisis. What a society invests in prevention, education, and justice it does not have to invest in weapons. Thus SOLIS defends itself most effectively not by striking harder, but by removing the fuel from which violence arises. In this order, strength means restraint, not aggression.

ECONOMY AND RESOURCES

Mara's flat cost nothing. It was part of the base, like the water, the bread, and the journey to work. The canoe cost value points, three months of her contribution, and she saved for it the way one saves for something one really wants. At the enterprise, the accounts lay open: what the enterprise needed in inputs, what it credited to those who worked there, how much went into the reserve, and how much into the region's fund. No one grew rich from it. But no one was ever afraid of the end of the month.

very social order, whether it says so or not, answers three economic questions: who owns what? How does value arise, and who receives it? And who decides what will be built tomorrow? Orders that had got everything else right have failed on these three questions. SOLIS does not answer them with one of the old recipes. It answers with an order that neither abolishes nor unleashes the market but limits it: basic provision as an entitlement, discretionary goods through a means of value that cannot turn into power, and capital that stays in many hands.

PROPERTY AND THE COMMONS

Property is among the most powerful and at the same time most contested concepts in human history. It has built and destroyed societies, brought forth inventions and fuelled wars, made freedom possible and legitimized oppression. Capitalism often regards property as freedom itself: whoever owns has power, security, and the ability to shape things. Socialism often collectivized property, on the assumption that private ownership promotes inequality and destroys community, and it frequently ended in bureaucratic rigidity, a lack of drive, and corruption in the administration. SOLIS does not trade one for the other. It seeks a new balance that uses the strengths of both principles and avoids their weaknesses: personal possessions remain inviolable, and the natural foundations of life are treated as a common good.

Personal possessions are protected in SOLIS because they are part of self-determination. One's own house, one's own clothes, one's own tools, savings for a project of one's own, books, keepsakes, and above all everything one has created oneself belong to the individual. They may own it, shape it, pass it on, and bequeath it. Possession in this sense fosters creativity, identity, and security. An artist keeps the full rights to her works, and a family keeps the right to live in the house it built and to pass it on to its children. You may be rich in ideas, in art, in projects, and in personal treasures. You may only not become rich by taking from others the air they breathe, the water they drink, and the soil they live on.

It is different with the great foundations of life: water, soil, air, sources of energy, and raw materials. They cannot belong to anyone privately, because no one created them, because they are the condition of everyone's survival, and because their misuse strikes whole societies, ecosystems, and generations, not only individuals. In SOLIS, therefore, an enterprise cannot acquire a water source and deny the population access to it. No investor can buy up land to let it lie fallow for speculation while people cannot find housing. No one can treat the air as if it were a commodity.

These commons are managed collectively, and, following the order of power, by the assemblies and offices of the level concerned, advised by expertise and reviewed by the ethics councils. They are not state property, because this order knows no state that stands above the people. Their use is regulated so that no one is starved or exploited and so that future generations keep access too. This is served by open platforms that show how much water, energy, or land is used where. It is served by limits on extraction that set how much may be taken without harming the system, by sanctions against building monopolies and shadow markets, and

by programmes that promote careful use. SOLIS thus resolves the false choice between unlimited private power, which destroys the collective, and total collective control, which stifles the individual. It grants freedom where it fosters creativity, invention, and identity, and collective management where survival and sustainability are at stake. From this grows balance, and from this grows trust. Individuals know that they have their space and their security, and at the same time that the foundations of life remain open to their children too.

BASIC PROVISION AND VALUE POINTS

For centuries, money was a central tool of humanity. It made trade possible and triggered crises, fuelled invention and plunged societies into poverty, promised freedom and created dependence. Under capitalism, money often becomes the measure of all things: whoever has it can buy influence, obtain security, and have a say over the rules. Socialism often suppressed or strictly controlled money and thereby frequently produced bureaucratic rigidity, shortages, and shadow markets. SOLIS does not simply replace money with a new means of exchange. It creates a dual order with a clear separation between basic provision and discretionary goods.

◆ BASIC PROVISION IS AN ENTITLEMENT, NOT A PAYMENT

In SOLIS, every person has a guaranteed entitlement to the foundations of life: housing, energy, food, health care, education,

and basic mobility. These are not market goods. They are not bought but provided. The assemblies of the levels plan the capacities needed for them, housing, waterworks, schools, clinics, and transport, and the enterprises that deliver them are funded from the community share, which will be discussed shortly. No one ever has to pay for basic provision. A young adult thus receives, without any service in return, the right to a basic flat, and a family receives staple foods as an entitlement, not for a fee. Basic provision is a base, not a luxury: simple, reliable, and the same for everyone. This secures the floor below which no person can fall, regardless of their employment record.

A base is of equal value everywhere, but it is not the same everywhere. No two basic flats are identical, and one looks onto the park while the other looks onto the street. Where goods of basic provision differ, a rule decides and not a connection: first need, that is, the size of the household and the distance to work, school, and care, then the order of registration, and where several people have an equal claim, the lot. Waiting times are public. If they grow, that is an instruction to the offices to build and to the monitoring of fundamental rights to report it. Whoever wants more than the base, the bigger flat or the better location, exchanges value points for it, because that is where discretionary goods begin.

◆ VALUE POINTS FOR DISCRETIONARY GOODS

For everything that goes beyond basic provision, the bigger flat, the journey, the musical instrument, the tools for one's own project, there are value points. They are tied to the person and bear no interest. They arise solely from real contribu-

tion, from work, care, raising children, invention, and voluntary service, measured by hours, qualification, and the needs of the community. They cannot be hoarded or traded speculatively, and their relative value reflects social usefulness, sustainability, and scarcity. An engineer receives value points for her work on an energy plant, a care worker for the daily care of people, an artist for her work, a father for the years in which he raises his children. What is decisive is what distinguishes such a means from money: it cannot turn into capital that multiplies itself and translates into power. The value point is a river, not a lake.

◆ HOW PRICES ARISE WITHOUT A CENTRAL PLAN

Here stands the hardest question for any economic order that pushes back the market, and SOLIS does not avoid it. A price is a piece of information. In a market, it arises from countless decentralized decisions and shows what is scarce and what is needed. An order that abolishes the market faces the question of how, without this signal, it intends to determine what things are worth, and history has shown that no central authority can calculate what a market computes. SOLIS does not claim this omniscience. It does not replace the market with a central plan. It limits the market.

For discretionary goods, the relative prices in value points are not decreed from above. They arise from decentralized signals, in three layers. The first layer is the signals themselves: suppliers and consumers report supply and demand, and relative prices move with actual scarcity and actual demand. Thus the information function of prices is preserved, which pure planning loses. The second layer is fixed limits. Ecological costs are compulsorily

included in every price, so that a flight across continents costs more points than a train journey and a harmful product more than a gentle alternative. At the same time, no one can narrow a market or build a monopoly, and every product carries an open product sheet that states its materials, energy, burden, and origin. The third layer is feedback. The entire system is transparent and open to review. Where the signals lead to unjust or unsustainable results, a correction loop takes effect that combines data and deliberation: the ongoing monitoring of scarcity and ecological burden on the one hand, and review by the ethics councils on the other. What is corrected are the limits, not individual prices by decree.

This solution is an approximation, not a perfect calculation, and it presents itself as such. It accepts a certain imprecision in allocation, because that is the price of avoiding both dead ends: omniscient planning, which is impossible, and the unleashed market, which becomes unjust. The design of the value point ensures that even where a price remains imprecise, it cannot become a lever for accumulation and power, because it cannot be hoarded, cannot be speculated with, and is tied to real contribution.

◆ SAVING WITHOUT CONCENTRATION OF POWER

That value points cannot be hoarded is aimed at oligarchy, not at provision for the future. Between accumulation that translates into power over others and moderate saving for a project of one's own there is a difference that the order respects. Value points therefore remain available for personal purposes over reasonable periods of time, for the house, the journey, the workshop, the year of a fresh start. Their limit and their expiry take effect only beyond

the threshold at which savings would become a lever over the lives of others. The same threshold applies at the end of life. Whatever value points a person leaves behind go to their relatives up to this threshold, and anything beyond it goes into the community share. Thus the means prevents the concentration of power without taking from individuals the ability to plan, and without dynasties forming over generations.

◆ THE COMMUNITY SHARE

How does an order without money pay for its schools, clinics, and waterworks? From the same river that carries everything else. Every credit of value points passes a share into the community funds of the levels: a fixed basic share on every contribution and a rising share above a threshold. Whoever receives a lot contributes proportionally more. That is not a punishment. It is the recognition that every income rests on the community, on its infrastructure, its education, its health, and its peace. From this community share, the enterprises of basic provision are funded, the basic pension is paid, the funds are filled, and the offices are maintained. It takes the place of taxation, and it differs from taxation in two ways. It is simple, because it arises at the source and no one has to declare it, avoid it, or collect it. And it is visible, because the review body discloses where every share goes. Whoever contributes sees what becomes of it.

◆ WHERE THE POINTS COME FROM AND HOW MANY THERE ARE

This leaves the question that every order with its own means of value must answer: who creates the points, and who decides how many there are? In SOLIS, a credit to a personal

account has two possible sources. Either an enterprise pays it out of what it has taken in for its discretionary goods. Then the point merely changes hands, and nothing new comes into being. Or a community fund pays it: for work in basic provision, for care, raising children, and voluntary work, for the service of those chosen by lot, for the projects of the funds. Only here do new points arise, and they arise solely against a registered contribution, never against nothing, never on credit, and never with interest. The community bank that creates them is itself ringed: partly chosen by lot, with changing membership, and scrutinized by the review body. No body can create points for itself.

The number of points in circulation must match what can be produced in discretionary goods. If there are too many, all prices rise at once, not only those of scarce things. If there are too few, goods remain unsold although people need them. Both can be read from a public figure, the general price level of discretionary goods, which the review body publishes continuously. The quantity is steered by three levers, all of them in the open: the basic value that one hour of contribution earns, the level of the community share, and the threshold above which points expire. The national assembly sets them, advised by the Council of the Wise and reviewed by the ethics councils, and it may change them only slowly and within a fixed range, so that no one becomes poorer overnight. What expires beyond the threshold, and what the ecological surcharge adds to harmful goods, dampens the system by itself, without anyone having to intervene. The quantity of points is thus no secret science. It is a public figure, and any change to it must be justified.

◆ THE INTERFACE WITH THE OUTSIDE WORLD

SOLIS does not live in isolation and therefore needs regulated transitions to the world of conventional currencies. A border exchange allows value points to be exchanged for foreign currencies. So that the inner nature of the value point, no accumulation and no speculation, is not undermined from outside, however, this border is a controlled membrane and not an open gate for arbitrage. Exchange by individuals is limited. It covers legitimate external needs such as travel or imports, but it does not allow points to be siphoned off into foreign assets. An outflow on a large scale, which would turn value points into foreign capital and import power back from it, is visible and capped. The same applies in the other direction. Whoever moves in from another order brings their rights with them, but not their power, because foreign wealth can be exchanged into value points only to the same extent as for anyone else and otherwise remains what it is: outside. A buffer fund keeps the exchange rate within a stable range and protects against external shocks and speculation, and the supply chains on which survival depends are secured at home or through several partners, so that no one can starve the order from outside. An enterprise that exports technology receives value points that can be exchanged at the border exchange within these rules. The very purpose of the border is to keep the inner order protected against the detour through foreign currency. The membrane lets value pass for real needs and seals the leak through which someone could escape the rule against accumulation.

◆ **TRANSPARENCY AND SECURITY**

All transfers run through community banks, which serve secure processing, transparency, and control against abuse, and no profit. The data are held on tamper-proof infrastructure. To the outside, the accounts are pseudonymous, and they can be linked to a person only by court order. Society sees the aggregate figures, not the life of the individual. Large allocations are subject to the four-eyes principle, patterns of collusion and sham services are detected and published, and whoever uncovers abuse is protected. In this way the economic order dissolves the dependence on money while keeping the benefits of regulated markets. No one has to fear being unable to meet their basic needs. No one can build a monopoly over air, water, or food. No invention fails any longer for lack of capital. Entitlements for survival and value points for shaping one's life: therein lie the balance, the trust, and the stability of this order.

ENTERPRISES, CAPITAL, AND INNOVATION

◆ **ENTERPRISES WITHOUT THE POWER OF CAPITAL**

Companies still exist in SOLIS, because they drive dynamism, skill, and specialization. This work calls them enterprises, because they undertake and run something rather than own something. An enterprise is a community of people who produce or provide something together. It keeps an enterprise account in value points, through which it takes in what it receives for the dis-

cretionary goods it supplies and pays out what it needs in inputs. From the rest, it pays for the contributions of its members. Whatever remains beyond that it may keep as a reserve for replacement and risk, up to a limit measured by its needs. Whatever exceeds that limit too flows to the members and into the community share. An enterprise can therefore do well and grow from its skill, but it cannot become wealth that buys up other enterprises, nor power that writes the rules. What it needs for investment and cannot cover from its reserve, it obtains from the funds. There is no capital market.

The people in the enterprise are participants, not commodities. They have a say over its management and the rules of their work, and the management is an office held for a term like any other. The success of an enterprise is measured not only by what is left over at the end but equally by its stability, its contribution to the community, its ecological balance, and its responsibility, and a public, transparent rating system makes these dimensions visible. An enterprise that pays its members fairly, uses gentle materials, and strengthens the local community is rated more highly than one that only cuts costs, and it more easily receives what it needs from the funds. The aim is an economy that creates real value instead of shifting numbers around: for the people who work in it, for the communities it supplies, for the nature it uses, and for the future it helps to shape. It is not about maximizing growth as such. It is about letting the right things grow: health, education, creativity, sustainability, and justice.

◆ THE MESHEDED ALLOCATION OF CAPITAL

Here lies hidden a question of power that no economic order may pass over. The value point is pure circulation. It flows, but it does not accumulate. This banishes accumulation as a source of private overwhelming power, but it has not disappeared. It has moved. Large projects require large means, and the decision about which project receives them is the most consequential economic decision of all. It now lies with the funds, which are fed from the community share and from the returns of successful projects. So that no new top arises here, the allocation of capital is not placed in one hand but meshed: many funds side by side, regional, specialist, and citizen-led, each built according to the order of power, partly chosen by lot, with changing membership, and accountable. What is decisive is the redundancy of routes. Whoever wants to realize an idea can turn to several independent funds, so that a no is never the no of the system. It is only the no of one door. A fixed share of the means is reserved for the dissenter who challenges the prevailing consensus. Thus the force that builds the future stays distributed and does not become a throne.

◆ INNOVATION WITHOUT A CAPITAL BARRIER

Research and development must not fail for lack of capital. The funds provide infrastructure, materials, laboratory time, and teams. Personal effort is paid in value points, and ideas and inventions become freely accessible after a reasonable period, while the inventor receives recognition and a return in value points from the proven benefit. A scientist who develops a new recycling process draws resources from the fund, his team is supported, and he himself is honoured for his contribution, without the invention

being locked behind a patent that denies the public access. Projects pass through open milestones at which they prove themselves or end. What fails, fails early and instructively instead of late and expensively.

WORK AND CONTRIBUTION

In most of today's systems, work is closely bound up with fear: the fear of not earning enough, of not being needed, of falling behind, or of becoming ill and burnt out and thus worthless. We have built societies in which work is above all a means of survival. The result is people who stay in jobs they do not love, a creativity that suffocates under daily toil, and inventions that are left lying because they yield nothing in the short term. SOLIS understands work differently: not as a compulsion to survive, but as an expression of creativity, contribution, and meaning.

Because the foundations of life are guaranteed in SOLIS, no one has to work in order to survive. That does not mean that no one works any more. It means the opposite. People get involved because they see meaning in it, want to contribute something and develop themselves, and because everything that goes beyond the base arises from contribution. A young mother teaches part-time because she enjoys passing on knowledge, not for fear of otherwise losing her security. An older engineer works on an energy plant because he wants to do something meaningful, not out of worry about the rent. Whoever contributes nothing does not lose basic provision, because it is tied to dignity and not to

performance. But they live on the base and not above it, and a community that makes contribution visible needs no coercion in order to expect it.

This leaves a question that every order without need must answer: who does the work that no one likes to do? First, the machine. Routine work as well as dangerous, heavy, and dull tasks are automated, so that people can concentrate on what machines cannot do: creativity, empathy, judgment, complex problem-solving, and social and emotional work. And where a person must still do it, the value point speaks. Work in a bottleneck, at night, in the cold, with dirt or danger earns more points per hour, because the needs of the community are one of the factors by which contribution is measured. What today is dismissed with the lowest wage because the poorest have to do it is paid highly in SOLIS because everyone needs it. So that automation does not make people superfluous, the funds support further training, retraining, and the fostering of talent, and innovation is open to everyone, not only to large enterprises. A pupil with an idea for a plastic-free packaging material gets access to an innovation centre without depending on wealthy parents or investors.

In an economy in which machines and artificial intelligence take over more and more of the necessary work, an old question arises anew: what do people work for, and by what is a successful life measured? SOLIS separates contribution from compulsion. What automation takes away in toil it gives back in time, for care, education, creation, and community. And the standard of success shifts. The successful person is not the richest, but the one who creates something lasting for the community. The dignity of work depends not on its yield but on its meaning.

DISTRIBUTIVE JUSTICE

Almost every political debate speaks of justice, and yet everyone understands something different by it: some absolute equality, others absolute freedom, still others a fair balance. In SOLIS, distributive justice does not mean that everyone receives exactly the same. It means three things: that everyone has enough for a dignified, secure, and fulfilled life, that whoever contributes especially much may enjoy more, as long as they do not live at the expense of others, and that extreme inequalities that divide society do not arise in the first place. This path follows from a double insight. Radical equality often stifles achievement and invention. Radical inequality poisons societies, destroys trust, and feeds violence.

The foundation is that no one has to fear for bare survival. Access to food, clean water, medical care, safe housing, education, and participation is secured, as a fundamental right and not as alms. A single mother does not have to worry whether she can feed and care for her children, and an old person does not fall into nothing. This is the condition of every further freedom, because whoever is fighting to survive cannot think freely, be creative, and develop.

Above this foundation, SOLIS recognizes that people differ in talent, drive, and capacity. Whoever contributes a lot, takes on responsibility, or drives inventions forward may also enjoy more: the bigger house, the longer journey, more means for their own project, more recognition. The only thing that matters is that this does not rest on exploitation. One may be prosperous because one

has created something, not because one has oppressed or cheated others. Rewarded, therefore, are the scientist with a medical invention, the enterprise that creates fair work and durable products, and the artist who enriches culture. Not rewarded are the speculator who makes money from money without creating value, the enterprise that shifts its damage onto the public, and the elite that defines itself solely through power and seclusion. In SOLIS this distinction is not a moral appeal but built into the means of value itself. Money cannot be made from money where there is no interest and no speculation.

So that the extremes do not arise in the first place, the order needs no redistribution after the fact, because its balancing mechanisms work at the source. The community share makes whoever receives more contribute proportionally more. The threshold of accumulation prevents savings from turning into power. The rule on inheritance prevents inequality from being inherited across generations. The means collected do not seep away into opaque coffers. They are invested visibly and verifiably in education, health, invention, and community. Innovation bonuses give whoever supplies ideas of long-term benefit not only recognition but also the means to realize them. Thus the order combines the security that people need in order to live without fear with the dynamism that societies need in order to move forward. It is not about demonizing prosperity. It is about linking it with responsibility and preventing extreme poverty, because it paralyses the whole of society, not only those affected. Where people experience the system as fair, trust arises, and trust is the glue without which the economy, politics, and community break apart.

SECURITY IN OLD AGE

How a society treats old age shows whether it values its people or drops them. In many existing systems, provision for old age is marked by fear: the fear of not having enough in old age, of ending in poverty despite a lifetime of work, or of becoming a burden on the community. Conventional pension systems come under pressure from demographic shifts, uncertain funding, and a life's achievement that is not fairly recognized. SOLIS, by contrast, guarantees dignity in old age as a right and not as alms. No one falls below a fixed level of dignity, whoever has contributed receives more in a traceable way, and the system remains stable even through demographic change.

This security rests on three pillars. The first is the basic pension: the entitlements to housing, energy, health care, and food apply in old age as in every other stage of life and secure a dignified life for everyone regardless of their employment record. The second is earned points. They are not a second money but the memory of a life's achievement. Every year of work, care, raising children, and voluntary service is credited as earned points according to hours, qualification, and need, and from their sum an ongoing payment in value points is calculated in old age, funded from the community share of the younger generations. The third is a productive fund, a collective, broadly diversified fund that invests in enterprises, infrastructure, and energy plants and whose returns from their real use, not from interest, flow to older people as value points. Because this security never rests on a single source, it holds even when one source weakens.

What is decisive is that a life's achievement counts in every form. Caring for relatives and raising children are fully credited, as a valuable contribution and not as a gap in one's life story. A mother who invests years in raising children collects points just as someone in paid work does. A factor for qualification and bottlenecks honours especially needed activities, while an annual cap protects against self-exploitation. A sustainability factor gently evens out demographic fluctuations instead of surprising whole age groups, and the productive fund is broadly diversified and designed to act counter-cyclically.

The order is also flexible and humane. A gradual entry into old age, for instance between 62 and 70, allows individual paths with a fairness factor. Whoever wants to contribute for longer is honoured for it, and whoever has to stop earlier does not fall into the void. In cases of reduced capacity to work, notional credits provide security, and surviving dependants are protected through the transfer of fund shares. The transition from the existing system is also designed fairly. Acquired pension rights are converted into earned points, a long phase in which both systems run side by side ensures a gentle changeover, and older age groups receive guaranteed minimums. Thus SOLIS takes the fear out of old age: no poverty in old age despite a lifetime of work, no penalty for care and raising children, no collapse from demographic imbalances.

THE CIRCULAR ECONOMY AND ENERGY

The conventional economy follows a destructive rhythm: take, use, throw away. Raw materials are extracted, processed into products, consumed, and in the end disposed of as waste. This linear system has left behind exhausted soils, polluted seas, toxic landfills, and destroyed ecosystems, and it has accelerated climate change. SOLIS breaks with this logic. The rules by which its economy runs in a circle belong here. The limits of the planet and the healing of the living world, which they serve, are set out in the following chapter.

In a circular economy, resources are not consumed. They circulate. Products are durable, repairable, modular, and recyclable, and planned obsolescence is prohibited. A device has standardized modules, so that when the battery weakens only the battery is replaced and not the whole device, and at the end of its life the individual parts return to the cycle. Residues serve as inputs to other processes, and enterprises are connected so that the residues of some become the raw materials of others. These rules do not stand beside the price but within it. Because ecological costs are included in every price in value points and every product carries its product sheet, the gentle option is cheaper than the harmful one, and the cycle is the default setting of economic activity, not the exception. The energy that drives all of this comes from sources that do not consume the planet. Its order, decentralized and resilient, is described in the chapter on the planet. Thus SOLIS breaks with the idea that the economy is a zero-sum game in which nature loses what the economy gains.

GLOBAL ECONOMIC COOPERATION

We live in a world connected by the economy. No country and no region stands alone any more. Raw materials, goods, data, and ideas flow across borders, and that can be a blessing or a curse. So far the curse has prevailed: free trade that maximizes profits but destroys communities, supply chains that rest on exploitation and environmental destruction, and geopolitical power games in which the economy is misused as a means of pressure. SOLIS also thinks of the economy globally. But it thinks of it as a cooperative network that benefits everyone and not only the strongest, and not as a raid.

Trade relations rest on fairness, sustainability, and respect. Agreements are not power games between giants but arrangements based on clear ethical principles: fair pay, ecological responsibility, respect for cultural particularities, and long-term partnership instead of short-term appropriation. An enterprise from a rich region may therefore not simply extract cheap raw materials from a poorer one without compensating the local communities and meeting ecological standards. The contracts must disclose how investment is made locally, which standards apply, and how both sides gain. Weaker regions are strengthened instead of being kept in dependence. In place of aid that entrenches dependence come the transfer of technology and knowledge, fair financing of infrastructure that builds local resilience, and partnerships on an equal footing in which local voices share in the decisions. Thus a region develops its own sustainable energy

systems with the support of global networks, but without gagging contracts that plunge it into eternal debt.

For this to succeed, SOLIS builds on concrete mechanisms. Open trading platforms make contracts and results visible and disclose conflicts of interest. Ethics councils for economic questions do not merely advise on major projects and agreements, they review them. Joint innovation funds, into which everyone pays according to their economic strength, share their results with everyone. How the world of many orders holds together as a whole without a ruler arising above it is set out in the chapter on the world order. Here the principle suffices: a networked world economy in which cooperation is stronger than competition, in which rules apply to everyone and not only to the weak, and in which invention is understood as a shared treasure. The world is too closely interwoven and too vulnerable to carry on the old patterns.

PLANET, ECOLOGY, AND REGENERATION

The river Mara worked on had smelled of oil when she was a child. Over twenty years, her enterprise had led it back into its old bed, bend by bend, and when the first salmon returned, the town held a festival. At every project on the banks, a steward sat at the table who spoke for the river and for those who would inherit it in a hundred years. She did not always agree. Sometimes she was right.

everything this work designs, the Ring, the law, the economy, education, rests on a precondition that no majority can decide and no assembly can revoke: a living planet. On a destroyed Earth, the question of the best order no longer arises. Responsibility for the planet is therefore not one of the five foundations among others. It is the one without which the other four would no longer have a place. This chapter brings together what follows from it.

THE PLANETARY BOUNDARIES

The starting point is an insight that comes before politics because it comes from physics: the planet has limits. Science has named them planetary boundaries, the stability of the climate, the diversity of living things, the purity of water, air, and soil, and beyond these boundaries the system that sustains all life tips over. We have exhausted soils, overfished seas, cleared forests, and pumped greenhouse gases into the atmosphere as if there were no tomorrow. Species are dying at a pace that approaches the great extinction waves of the Earth's history. We know it, we have known it for decades, and we act as if we had endless time. It follows that SOLIS treats the limits as what they are: as a wall within which all economic activity and all freedom have their space. Ecological costs are compulsorily included in every price, so that the harmful is more expensive than the gentle. Limits on

extraction are not left to the market but set by the assemblies and monitored by the review body. Once something has been recognized as a limit of survival, no economic boom can lift it again.

REGENERATION INSTEAD OF MERE PRESERVATION

Where too much has already been destroyed, protection is no longer enough. SOLIS therefore goes beyond preservation to restoration: not only to do less harm, but to heal actively. Forests are not only preserved but brought back. Soils are not only spared but built up. Rivers are not only less polluted but led back into their old beds and back to life. Methods that draw carbon out of the atmosphere and return it to soils and forests are part of this healing, but not a substitute for it. They stand beside avoidance, not in its place. The standard of success thus shifts from the least harm to the greatest recovery. A generation that gives back to the planet more than it takes reverses the direction in which humanity has long treated the living world.

THE CLOSED CYCLE

Nature knows no waste. What one being excretes is the food of another. SOLIS makes this principle the basic form of economic activity, and the economic order has shown how it is

built into prices and into the rules for products. In place of the straight line from extraction through use to rubbish comes the closed cycle. Materials are used, reused, and recycled at high quality for as long as possible, repair comes before replacement and reuse before consumption, and whole industries are connected so that the residues of some become the raw materials of others. A disused device casing is not burned but dismantled, cleaned, and turned into new products. This goes beyond recycling. It is a design built for circulation from the start, and it also changes the people who live in it: whoever repairs instead of throwing away builds up a relationship with things again.

Yet this circle does not merely go round in circles. It keeps materials flowing and at the same time carries knowledge and prosperity upwards. A cycle in matter, progress in mind: that is the spiral in which a civilization can endure without consuming itself.

THE RIGHTS OF THE LIVING WORLD

SOLIS widens the circle of consideration beyond human beings. An ecosystem, a river, a forest are not merely property and raw material. They carry a weight of their own that counts in decisions. Animals are sentient beings whom the order spares suffering where it can, and husbandry that turns them into mere material has no place in it. Where far-reaching projects touch the living world, it receives a voice through appointed stewards, who represent its concerns before the assemblies, the ethics councils, and the courts, just as a guardian represents the concerns of someone who

cannot speak for themselves. And because the planet also belongs to future generations, every extraction is subject to the condition that those who come after still find it habitable. It follows that the ethics councils explicitly examine projects against this double claim: towards the living world and towards the people to come. An ethics that means only human beings is too small.

AGRICULTURE AND FOOD

Nothing connects people more closely with the planet than what they eat. Agriculture in SOLIS therefore works with nature instead of against it. Soils are built up instead of exhausted, through crop rotation, humus formation, and agroforestry, forests are managed so that their diversity remains, and fish stocks are used only to the extent that they stay stable in the long run. Factory farming, which causes suffering, devours land, and burdens the climate, is phased out. Whatever animals are kept are kept as befits beings that feel. Food is at the same time part of basic provision. Staple foods are an entitlement, and because ecological costs are included in every price, what is regional, seasonal, and gentle is the obvious choice among discretionary goods too, not the expensive luxury. Thus food begins with respect: for nature, for animals, and for one's own body.

ENERGY AND THE LONG FUTURE

The material basis of a lasting civilization is energy that does not consume the planet. SOLIS therefore builds on renewable, decentralized, and resilient energy systems: sun, wind, water, and geothermal heat, connected by storage and intelligent grids that balance out fluctuations. Through the funds, it invests in what could lead beyond them, from fusion to storage that does not yet exist today, without building the present on promises. Fossil fuels are replaced entirely. And energy is not only produced differently but also used less. A product that lasts a lifetime, a town in which distances are short, a grid that wastes nothing save more than any plant supplies.

That supply is distributed has more than ecological reasons. A distributed supply absorbs failures that would knock down a central one. If one part fails, the others carry the load, and no single node holds the supply of society in its hand. Thus ecological necessity meets the logic of the whole work: no monopoly over a central resource, but a network that is strong in being distributed. On this basis, a planet that is recovering and an energy that does not devour it, the distant future of which this work speaks becomes possible in the first place. In doing so we are not saving “the Earth”. The Earth would manage without us. We are saving ourselves.

EDUCATION AND KNOWLEDGE

At thirty-nine, Mara had started learning again: soil science, because the river could not be understood without the soil. No one asked why she was doing it at thirty-nine. The course cost nothing, the enterprise gave her the time, and at the end her profile did not show a grade but what she could now do. That same year her daughter Ida, sixteen, sat in a class that was just learning to question every authority. Including the order she lived in. Including this book.

Imagine a world in which no child ever again has to say: I am not allowed to learn. I am too poor. I am too stupid. I am too old. I am too different. In this world, education is not a luxury, not a business, and not an instrument of power. It is a basic human right, as indispensable as water, food, and safety. That is the world this chapter describes, and at the same time the point at which it is decided whether an order forms subjects or people who can examine it.

EDUCATION AS A RIGHT AND A FOUNDATION

In SOLIS, education is a fundamental right, and this commitment follows from the insight that education is far more than the transmission of knowledge. It is access to information, the capacity for reflection, the possibility of development, and the key to self-determination, participation, and dignity. Without it, people remain dependent and vulnerable, poverty reproduces itself from generation to generation, and inequality is inherited. Whoever secures education thereby secures all other rights along with it. Whoever denies it takes from people the foundation of their freedom.

Access is free and without barriers. Every person has a right to education, and from birth, because education does not begin only at school but in the family and the community, and it does not end with a qualification but accompanies the whole of life. An

expectant mother receives access to advice and learning materials. A young person with a disability receives learning systems that foster their strengths and offset their barriers. An older person can continue learning new languages, techniques, and subjects at no cost.

Because not everyone learns in the same way, the education system is adaptable. It takes account of different paths of learning, respects cultural diversity, and understands disabilities not as deficits but as variations of human experience. Digital platforms, shared learning spaces, and professional support ensure that content is prepared flexibly and tailored to particular needs. Artificial barriers fall away. There are no costs that reserve education for the wealthy, no admission barriers that make opportunities depend on origin and connections, and no discrimination that systematically excludes minorities. A highly gifted young woman from a poor household does not have to go into debt in order to study. A worker who wants to change direction at fifty is not blocked by bureaucracy. A refugee receives immediate access to language and learning instead of years in waiting loops.

All this is carried by a collectively supported educational infrastructure of schools, libraries, learning centres, and digital platforms, because education counts as a shared gain and not as a commodity. It belongs to the basic provision to which everyone is entitled. Its content is scientifically sound, ethically reflected, and presented in varied ways. From the outset, this draws a line to which this chapter will return: no indoctrination, no propaganda, and no dictation of “correct” opinions.

LIFELONG LEARNING

In most societies today, learning is organized like a closed stage of life: first school, then training, then working life, and with that a person is considered finished. In a world that changes quickly, this idea is disastrous, because standing still means falling behind, and yesterday's knowledge is not enough to solve tomorrow's problems. SOLIS assumes that learning never stops. Not because people should optimize themselves without pause, but because learning is part of being human, an expression of curiosity, growth, and connection.

Every person therefore has lifelong access to a broad range of learning opportunities, to formal institutions as well as to informal formats and self-directed paths. A craftsman who wants to train in sustainable architecture at forty finds open courses and mentors. Someone returning after years away receives programmes that bring them up to date. A young woman with a rare interest works with researchers early on. Learning is neither a stigma nor a status symbol but a natural part of life. No one is smiled at for still learning in old age, and no one is excluded because their learning is informal.

For this to be possible, the world of work must promote learning instead of punishing it. In many jobs today, further training is a private burden without time and without means. In SOLIS, enterprises are obliged to make continuous education possible, working hours are arranged so that there is room for phases of learning, and new roles and paths arise through lifelong development instead of through a single qualification. An experienced

care worker who wants to move into robotics is supported in this and not held back. Phases of learning are secured, because basic provision does not depend on paid work, so that no one has to go into debt for education. In place of the one qualification that decides about a person for a lifetime comes a growing profile of what they can do. Projects, experience, contributions to the community, and formal examinations count equally, and no door closes forever because an exam went wrong at seventeen. Thus a society arises that stays curious at every age and grows wiser and more adaptable together.

ACCESS TO KNOWLEDGE AND TRANSPARENCY

In the age of information, knowledge is more than power. It is the basis of survival, invention, and freedom. And yet in most of today's systems it is not free but hidden behind paywalls, frozen in patents, hoarded in data monopolies, and instrumentalized by governments and corporations alike. SOLIS treats knowledge as a common good, not out of romanticism but out of necessity, because a society that shares knowledge is more resilient, more inventive, and more just.

To this end, SOLIS maintains open, multilingual, and barrier-free knowledge systems that make scientific findings, technical developments, historical sources, and cultural works accessible, supplemented by local knowledge centres, so that people without digital infrastructure have access too. A village community can thus draw on the same medical knowledge as a research laboratory,

and a young person has access to the teaching materials of the best universities. What was supported collectively belongs to the community. Studies, data, and methods from publicly funded research are freely accessible, which multiplies inventiveness, avoids needless duplication of work, and creates trust.

The invention of individuals remains protected, but not at the expense of the public. As the economic order lays down, whoever invents receives recognition and a return from the benefit of their invention, while the invention itself becomes open to everyone after a reasonable period. In areas such as medicine, environmental technology, and basic provision, the public takes priority from the outset. An enterprise that develops an active ingredient is honoured for it, but in a health crisis the ingredient is open to everyone who needs it. Thus knowledge does not become a commodity but remains a life force open to all, an application of the transparency that SOLIS also demands of its own institutions.

CREATIVITY AND CRITICAL THINKING

In many of today's education systems, the hidden message is to take in what is given and reproduce it correctly. Conformity is rewarded, not deviation. In a world that is becoming ever more complex, that is not enough. A society needs people who see new paths, question old patterns, and look at problems from unfamiliar angles. SOLIS therefore understands education not as a store of knowledge but as a space for thinking and exploring, in which it is not only about the what but equally about the how and the why.

Even children therefore learn not only facts but methods: to analyse a situation, to recognize patterns and contradictions, to ask precise questions, and to distinguish between superficial and deeper causes. A historical event is not tested by rote but worked through: why it happened, what perspectives there were, what could have turned out differently, and what parallels exist with the present. Creativity is not considered a decorative extra but a core competence in art and science as well as in the economy and everyday life: the ability to connect the unexpected, to bear uncertainty, and to dare something new without fearing mistakes. An education system that works in this way does not fill vessels but lights a fire. It allows teachers to be challenged, lets projects fail and still be valuable, and measures not the ticking off of knowledge but the finding of one's own solutions.

◆ THE MATURITY TO QUESTION SOLIS TOO

Here lies a commitment that is decisive for the whole work. Critical thinking that stops short of the existing order is not critical thinking but its opposite. Education in SOLIS therefore explicitly teaches people to question every authority, including SOLIS itself, its institutions, and its office holders. It gives people not only the values of the order but the tools with which to recognize whether the order lives up to these values, and with which it can be changed or abolished if it does not. Precisely here lies the strongest protection against any order hardening into dogma and against the manipulation of the public sphere of which the chapter on the order of power speaks. A population that has learned to check sources, compare perspectives, and question power cannot be ruled. SOLIS asks of its citizens not obedience

but judgment, and thereby accepts being measured by it and, if necessary, rejected by it.

ETHICAL EDUCATION

At a time when technology, power, and knowledge create ever greater levers, it is not enough to treat ethics as a minor subject. A single person today can paralyse systems, alter genetic codes, or influence the lives of millions through supply chains and data flows. If these levers are operated by people who think only of themselves, the result is injustice and destruction. SOLIS therefore makes ethical education not a special programme but the foundation that runs through all areas.

Ethical reflection is built into every discipline. In the natural sciences it is about responsibility for the environment and for consequences, in economics about fairness and sustainability, in medicine about patients' rights and fair access, in technology about the question of misuse. Every subject includes reflection on responsibility, and every project thinks through its ethical consequences and not only its usefulness. Whoever builds an application in class asks at the same time whom it benefits, whom it endangers, and what happens if it is misused. This education begins early. Even children learn to consider the consequences of their actions, to put themselves in others' shoes, and to take responsibility, by drafting rules together, resolving conflicts, and talking about real dilemmas. And it makes ethical discussion normal, in schools, the media, and neighbourhoods, because a healthy society does

not shy away from questions such as those about the good life, responsibility for future generations, and the limits of freedom, but needs them.

◆ EDUCATION, NOT CONDITIONING

This raises an objection that SOLIS takes seriously and does not play down. A society that shapes its young towards the values by which it lives is always in danger of letting education turn into conditioning, and formation towards maturity into training for docility. It is precisely this step that SOLIS refuses, because it would be the authoritarian move that the whole order fights against. The line runs at a single point. A society may educate its young towards the values that sustain it, but only in a form that preserves the ability to examine and reject these values. Ethical education in SOLIS therefore does not implant fixed “correct” convictions. It develops independent moral judgment, the ability to measure SOLIS too by its own standards. Formation that leaves people free is education. Formation that binds them is indoctrination. Only the first is compatible with the foundations of this order.

GLOBAL KNOWLEDGE NETWORKS

The great questions of this century, climate, energy, health, peace, and technology, know no borders and require global answers. Such answers arise only when knowledge is freely connected across countries, cultures, and disciplines. In SOLIS,

schools, universities, and research centres are therefore not isolated islands but part of a global network that shares data and methods, carries joint projects, and forms communities of learners and teachers across borders. A school on one continent works with a school on another on a reforestation project, combining local knowledge of plants, climate data, and technology into a model that works in both regions.

In SOLIS, “global” does not mean “Western” but diverse and mutually enriching. The knowledge that counts is not only that of the great universities but also that of Indigenous communities about ecosystems, of craft cultures about durable products, and of artistic movements about expression and change. A project on clean drinking water can thus combine advanced technology, traditional methods, and clever design into a solution that is adapted locally, usable everywhere, and culturally respectful. In this way people learn not only about other cultures but with them and from them, and the intercultural judgment arises that creates trust where others build walls. Knowledge thus becomes a global network of points of light that illuminate one another.

HEALTH AND WELL-BEING

When Mara's father received the diagnosis, there was no bill, no waiting list, and no question of whether it was still worth it. There was a doctor who read the machine's suggestion, explained it, and disagreed with it. There was a room in the house that Jonas set up with a care team, and credit for the hours the family spent at the bedside. And there was, in the end, a farewell without pain, at home, with the river outside the window.

Imagine a world in which no one is afraid of falling ill, because they know: I will be cared for, I will be taken seriously, and I am not alone. In most of today's systems, by contrast, health is a risk and a cost factor, a playing field between insurers, industry, and politics. Whoever has money receives treatment. Whoever has little receives rationing and waiting lists. Whoever is unlucky receives nothing in the end. SOLIS breaks with this logic. Health is not a market product but a right, a non-negotiable, non-commercial human right, and, as the economic order lays down, it belongs to the entitlements to which everyone is entitled without anything in return.

HEALTH CARE FOR ALL

Access is equal and of high quality for all, and it is meant to be humane and holistic. Holistic care does not only treat symptoms but understands their causes. It sees not only the body but also the soul, the mind, and the environment. A worker with chronic back pain therefore receives not only a painkiller but access to physiotherapy, work-related prevention, and psychological support, because health is more than merely functioning. From the start, this care includes prevention, mental health, and social support, because health depends not only on genes and lifestyle but also on security, community, and meaning. The health system therefore works together with social work, education, and neighbourhood

networks. A young mother with postnatal depression receives, alongside medical help, a network of parents, counselling, and support, and she is seen as a whole person, not as a case.

All this is funded from the community share, which secures fairness and stability. Basic medical care is carried in solidarity, administered transparently, and knows no two-tier medicine and no fear for one's existence because of a bill. Doctors, nurses, and therapists work in teams. Care reaches town and country equally, through local centres, mobile practices, and telemedicine, and people have a say when decisions are made about resources, priorities, and new procedures. Enterprises that offer optional services may exist, but they may never undermine the basic system or create privileged parallel worlds, because the market ends where life begins. Thus health becomes a common good and an expression of the ethical condition a society is in.

PREVENTION INSTEAD OF REPAIR

In most of today's health systems, the same pattern repeats itself. People live in unhealthy conditions and fall ill, and only then does the system react, late, expensively, and after the fact. It is like a fire brigade that arrives only when the house is already burning, instead of making sure that houses are built safely. SOLIS understands health not as a repair shop but as an active, forward-looking process that starts where illness arises. Prevention means more than the appeal to behave more healthily. It means shaping the entire environment so that health becomes the normal case,

and recognizing problems early, before small ones become big. A young person who begins to isolate himself finds connection early, before depressive patterns take hold. An employee under heavy strain is offered other arrangements in good time, before she burns out.

Health is thus a cross-cutting task that is not offloaded onto the individual but carried by society. Urban planning creates green spaces, clean air, and safe routes. The world of work ensures healthy hours and a say for employees. Food systems make the healthy choice the affordable standard, education teaches from an early age what strengthens body and mind, and leisure activities are easy to reach and open to all. Thus prevention becomes a natural part of everyday life, from uncomplicated check-ups through easily accessible advice to offers of exercise and nutrition that suit people instead of patronizing them. Such a town offers exercise as joy and not as stress, healthy food in schools and enterprises, and time for rest, and enterprises gain healthy, motivated people instead of worn-out workers. Prevention saves not only resources, it saves suffering, and it makes a system more agile and more durable, because it recognizes developments early instead of chasing after catastrophes.

MENTAL HEALTH

In many societies, mental health is considered a private matter, a flaw about which one had better stay silent, with the result of stigmatization, shame, isolation, and overcrowded wait-

ing lists. SOLIS reverses this picture. Mental health is as central as physical health, it is a social and not only an individual matter, and it is not attended to only when someone breaks down but considered and cared for from the start.

Every person has a right to psychological support, without bureaucratic hurdles, without ruinous costs, without months of waiting, and without the fear of stigma. This includes counselling and care services everywhere, crisis help that can be reached reliably, and tiered systems of help that range from preventive counselling to intensive therapy. A young woman with the first symptoms of anxiety finds access immediately and not only after months. Mental health, moreover, is not a matter for clinics alone but a cross-cutting concern that is considered everywhere. In schools this happens through programmes for resilience, mindfulness, and an open climate of conversation, and through people pupils can confide in. In the world of work it happens through compulsory prevention of overwork, flexible hours, and managers trained in their responsibility for the mental health of their people. In communities it happens through neighbourhood centres and easily accessible points of contact.

This requires a social climate of openness in which one may say that one is not doing well and, instead of being rebuffed with the demand to pull oneself together, finds a hearing. For many of today's burdens, exhaustion, depression, loneliness, and anxiety, are not individual weaknesses but consequences of the system: of overload, isolation, and loss of meaning. An order that recognizes this and creates structures for prevention and healing gives people permission to be human and at the same time spares itself the high follow-on costs of suppressed suffering.

SOCIAL HEALTH AND COMMUNITY

When people talk about health, they think of the body and perhaps of the soul. There is, however, a third, often invisible dimension: social health, that is, the question of how connected a person is with others. The research here is clear. Loneliness harms health to a degree comparable to smoking, and people who are socially connected live longer and more healthily. Community is not a pleasant extra but a basic biological, psychological, and cultural need, and SOLIS makes it a task of the system.

In SOLIS, community does not arise by chance but is consciously shaped and protected. Architecture, urban planning, and public spaces are laid out so that encounter and mutual support come easily. Clubs, networks, and easily accessible opportunities for exchange receive space and support, and places such as parks, libraries, and community centres remain open and are not taken over by commerce. Loneliness is not considered private misfortune but a social problem that is tackled deliberately: by paying attention to where isolation arises, for instance among old people, single parents, or newcomers, and by programmes that create connection. An older woman whose children live far away thus remains part of a network across the generations, in which she contributes her experience and at the same time finds support.

Linked to this is a different understanding of strength. Where many societies today teach that everyone should look out for themselves and show no weakness, SOLIS holds that real strength grows from connection, compassion, and cooperation. Children therefore learn not only specialist knowledge but how to deal with

feelings, how to work in a team, and how to take on responsibility. Care is not devalued as a lesser activity but highly esteemed and paid as a contribution. A society that fosters community is more stable, more peaceful, and more creative, because people catch one another when they fall. And like every good order, it measures itself by how it treats the weakest, not by how brightly the strongest shine.

DIGITAL HEALTH SYSTEMS

The digitization of medicine brings hope and fear at the same time: the hope of better diagnoses and easier access, the fear of misuse of data and cold automation. SOLIS takes a clear path here that follows the principles of the whole order. Technology is a tool in the service of people, not a ruler over them. It extends what people can do but never replaces what only people can do: compassion, presence, and relationship.

Every person has a digital health record that brings together all essential information, is securely encrypted and stored in a decentralized way, and is made accessible only with their consent. In an emergency, rescue workers have limited access to the relevant data without laying bare the whole profile. Control over the data thus lies, as the order generally requires, with the person themselves and not with a private exploiter. Artificial intelligence supports the system at many levels, in evaluating findings, in the early detection of rare diseases, and in personal recommendations, but it is never the deciding authority. The rules that the

chapter on technology lays down for every artificial intelligence apply. Human oversight is compulsory, decisions are not blindly automated, and patients have the right to understand a recommendation, to question it, and to reject it. A doctor examines the suggestion, discusses it, and explains the alternatives instead of simply following it. Telemedicine, mobile services, and wearable devices overcome distances, so that people in remote regions also gain access to modern care and a chronically ill person receives help in time through a connected device. In all this, however, a limit applies. Technology can explain, monitor, and improve, but it cannot hold a hand, cannot comfort, and cannot understand what it means to be human. Digital systems create time, reach, and precision, but the heart of healing and care remains the human relationship.

GLOBAL HEALTH NETWORKS

There is a contradiction in today's world: diseases know no borders, but health systems very much do. When a virus breaks out, an environmental toxin is released, or a biotechnological danger looms, nations often react with isolation, blame, and the logic of national advantage, and this costs time, lives, and trust. SOLIS holds that health is always global, because what happens anywhere affects everyone, and it builds structures that work across nations and beyond the profit motive.

These include internationally connected early warning systems that detect medical, ecological, and technical signals early

and share them openly, supported by local laboratories and sensors, by analyses that are always accompanied by human review, and by crisis teams that act quickly and in a coordinated way. If a new kind of fever appears in a remote region, it is neither covered up nor waited out. A coordinated response of analysis, support, and action takes effect. Medical breakthroughs are not a geopolitical toy. Research results are shared instead of hidden, medicines and vaccines are distributed according to need instead of market power, and the recognition of inventors never comes at the expense of justice. A vaccine against a dangerous virus is therefore made available deliberately where it is needed most urgently.

That wealthy regions support the building of robust health systems in poorer ones is, in this order, not charity but rational necessity. A virus that rages uncontrolled somewhere spreads everywhere, and a weak system endangers not only the people on the spot but the whole of humanity. Investment in infrastructure, training, and decentralized production therefore serves the security of supply for everyone. Thus every person has a better chance of staying healthy, regardless of where they were born, and the competition between states becomes a shared project: a community of fate that shares its knowledge and its means because that is only natural.

OLD AGE AND FAREWELL

An order that takes people seriously accompanies them across the whole arc of their lives, up to the end. In SOLIS, old age is not a time of being shunted aside but a full stage of life. Older people remain part of the community, their experience is needed, in the assemblies, in the schools, and as mentors of the young, and their care is a respected task that society carries together, not a burden to be hidden. Where a person depends on care, they receive it without losing their dignity, and whoever gives it receives recognition and credit for it. And because life includes its end, SOLIS gives dying a humane framework. No one should have to die alone, in avoidable pain, or degraded. Accompaniment at the end of life, the relief of suffering, and respect for the will of the dying belong to a health order that not only keeps people alive but lets them go with dignity.

CULTURE AND MEANING

On the evening of the festival of lights, the town dimmed its streets, and Mara stood on the bridge with her son Levi and counted stars. In the afternoon, a theatre group had performed the regional assembly in the market square, with a cook who asked about everything and a hydraulic engineer who talked too long. Mara had laughed until she cried. Later she went to the house of silence, as on every anniversary of her father's death, and sat for an hour with nothing.

n a world that is becoming ever faster and more technical, something that lies at the core of being human is in danger of being lost: culture. It is not merely entertainment or decoration. It is the memory and the inner compass of a society, what carries people, tells them who they are and where they come from, and builds bridges between past, present, and future. And it is the place where a society asks the question that no economy and no technology can answer: what all of this is for. SOLIS therefore recognizes culture and meaning as a fundamental dimension, not as a side issue.

CULTURE AS A LIVING HERITAGE

Every cultural heritage is considered valuable, whether great or small, global or local. There are no important and unimportant cultures, and no great and small stories. An Indigenous story weighs as much as a classical work, a regional dialect as much as a world language. Cultures may change, grow, and mix, and at the same time they may protect what is sacred to them. A community may decide for itself which of its traditions it shares and which it keeps, instead of leaving them open to access from outside.

So that culture is not left to the market or to chance, there are programmes for preserving, documenting, and caring for it: archives that safeguard languages, stories, and works, support

for those who create and pass on culture, and spaces in which cultural knowledge stays alive. A programme that brings younger and older people together so that the older ones can share their stories, songs, and recipes preserves culture not as nostalgia but as a living way of being together. For people need roots in order to find their bearings, and societies need culture in order to create cohesion and resist uprooting. Diversity is not a problem here but a wealth.

ART, MUSIC, AND LITERATURE

In many societies today, art has become a luxury good, a market object, or a prestige project. Yet it is far more: the language of the soul, the tool with which a society looks at itself, and the laboratory of new ideas and feelings. It is the link between the individual and the community, between reality and vision. SOLIS therefore makes art, music, and literature a load-bearing pillar.

Artistic creation is promoted, not merely tolerated. The funds support artists in every field, regardless of market value and mass taste, and the experimental and critical in particular receive space. A theatre group working on a play about social inequality is supported because it matters to society, not because it sells. Art is not a spectator sport. Children and adults alike are encouraged to create for themselves, to paint, make music, write, and act, without pressure to perform and without elitist barriers, and older people contribute their stories, from which the young learn.

Art is judged not by its market value but by its expressive power, its sincerity, and its social impulse. Street art, digital art, and traditional forms are taken equally seriously, and whoever takes up social or ecological questions finds particular support. A young person seeking their expression in graffiti therefore receives not just a criminal complaint but walls, workshops, and guidance to make something of their energy. For art gives the individual a voice and works for society like an immune system. It senses where something is sick, makes visible what lies beneath the surface, and builds bridges where words fail.

SPIRITUALITY AND PHILOSOPHY

In many modern societies, the search for meaning is considered a private matter, religion something that does not belong in the public space, and philosophy the concern of a few specialists. But human beings need more than food, housing, and technology. They need meaning, depth, and a relation to the whole, and they need spaces in which to ask the great questions: who they are, what life means, and what we owe one another. SOLIS recognizes this dimension as fundamental and makes it part of the social order. Every form of spirituality is respected as long as it does not harm others. Religion, unbelief, and every form of the search for meaning stand side by side with equal rights. No one is forced to believe anything, and no one may impose their faith on others. A believing woman can practise her rituals as freely as a monk meditates or a thinker argues in philosophical conversation,

and the protection of this freedom ends only where discrimination or coercion begins. For this there are public spaces of silence and reflection open to all: a house of silence where people go to pray, meditate, reflect, or be alone, whichever tradition they follow. And there are shared festivals and days of remembrance that are bound to no religion and celebrate humanity.

Philosophy, finally, is not a project for elites but a tool for everyone. Children learn early to think about the good life, about justice, and about happiness. Adults find spaces for asking questions together, where it is not about the one right answer but about thinking itself: evenings on which people from all walks of life talk about love, death, responsibility, courage, and failure. A society that allows such questions is more resilient and more compassionate, because it meets the uncertainty of existence not with distraction but with depth. This connects directly with the maturity that the chapter on education establishes. Meaning cannot be decreed, only found, and an order that takes this seriously invites reflection instead of steering it.

RITUALS AND SHARED EXPERIENCES

In the modern world, much has become functional, work, consumption, even leisure, and there is often no room for what is experienced together, for moments that step out of the stream of everyday life. SOLIS sees in this a basic human need. Rituals are not merely folklore or religious tradition. They are bridges:

between people and generations, between humans and nature, between the individual and the community.

In SOLIS, rituals are not prescribed but allowed to develop. They arise from people's needs and experiences and may change and reinvent themselves. There is room for traditional forms as well as for new ones, for instance ecological or artistic ones. A town develops a festival together with its citizens in which art, music, nature, and community come together, not as an attraction for visitors but as an expression of a living identity. At a festival of lights, whole towns dim their lighting, and people stand together under the stars. Such rituals can be religious or cultural, social or ecological, and they create moments of pause, connection, and meaning.

In a world that is often restless and fragmented, they are the moments that remind us that we belong together and share something greater. They are not merely a programme but lived meaning, and they strengthen the community because they show that it is more than the sum of its parts. For this to succeed, communities receive the means to cultivate and develop their own rituals, and participation remains open to all, regardless of origin, faith, or position.

MEANING AND PERSONAL FULFILMENT

In many modern societies, work is considered a means of earning money, success is equated with career and possessions, and relationships are a private matter. A decisive question remains

unanswered: why we do what we do, and what truly fulfils us. SOLIS places this question at the centre, because a good society is not only efficient and prosperous. It is a space in which people can find meaning, not prescribed and not uniform, but personal and alive. In SOLIS it is natural that people may ask themselves what matters to them, where they want to make a difference, and how they can be part of something greater without losing themselves. Children are encouraged to be curious and to try things out. Young people are accompanied in discovering their vocation, not only according to income but according to passion and contribution. Adults have the right to change direction when their path no longer fits, so that an engineer who longs for social work can retrain without fear of losing status. Life is not divided into useful and superfluous areas. Work should not only function but make sense, and a contribution such as voluntary work with children is valued and recognized as a contribution even if it produces nothing.

To this end there are offers that help people find their own trail of meaning: counselling, mentoring, and spaces for reflection, communities that support people through transitions, and an education that includes not only specialist knowledge but the development of personality. This is more than a soft concern. A person without meaning becomes inwardly empty and alienated, and a society full of alienated people is sick, however brightly its façade may shine. Every person has a right to a life worth living: not only to survive, but to live.

JOY IN LIFE AND HUMOUR

An order that takes being human seriously must also take laughter seriously. Laughter heals. It breaks rigid patterns, opens hearts, and creates community, and a society that can laugh at itself is vaccinated against the fanaticism that threatens every great idea. SOLIS therefore recognizes humour and joy in life as a resource, not as a distraction. Festivals, play, music, sport, and rest are not breaks from real life but part of it, and rest is not a luxury but a foundation of health. The rituals of this order allow irony and self-criticism, its art may mock, and its office holders must put up with being caricatured. A design that could no longer be smiled at would have ceased to be a design and become a dogma. That is exactly what SOLIS never wants to be.

GLOBAL CULTURAL EXCHANGE

The present knows two opposing movements. On the one hand, cultural interconnection is growing. On the other, fears of appropriation, loss of identity, and being overrun by the foreign are growing. This gives rise to insecurity and mistrust, and lively exchange is often replaced by retreat and reproach. SOLIS takes a different path and understands global cultural exchange not as superficial decoration but as a necessity in a closely interwoven world.

Exchange is therefore deliberately fostered: through partnerships between schools and cultural centres, through cooperation between artists across borders, and through festivals and platforms that connect not only elites but also local initiatives. A music festival does not merely put people from different continents on stage one after another but lets them create something together that no one could have invented alone. The question of cultural appropriation is neither condemned wholesale nor ignored recklessly, but handled with awareness and conversation: where does a form come from, what does it mean, and who has access to it? Marginalized groups can protect their forms of expression, and cultures may share what they want to share and draw limits where they wish. Whoever wants to work with the patterns of a community therefore enters into an exchange with it instead of merely copying it.

Thus diversity is understood as a treasure and not as a threat. People discover new perspectives and forms of expression, which broadens horizons and strengthens compassion. Societies that live exchange are more resilient and more creative, and in a connected world the great challenges can only be met together. Instead of entrenching themselves behind walls, people come together in open squares and let art, music, and ideas flow, as a shared treasury of humanity.

FREEDOM OF CULTURE AND FLEXIBLE IDENTITY

Culture gives meaning, creates identity, and connects generations. But it can also divide when it is captured, and serve propaganda when it submits to power or the market. In many of today's systems, it becomes either a commodity or a tool of ideologies and loses its free, connecting character along the way. SOLIS understands culture as free, diverse, and at the same time carried by the community. Art, language, religion, and tradition can be freely chosen, no one is forced to give up their cultural identity, and culture may be critical and question authorities, including the order itself, in keeping with the maturity that the chapter on education establishes. An artist may therefore create political art without fearing censorship or commercial pressure, and a community may cultivate its traditions as long as it respects the immovable threshold of fundamental rights. So that culture belongs to everyone and not to a few, it remains a common good. Museums, libraries, theatres, and digital archives are open, education carries diversity forward, and cultural creation is supported by the funds instead of by market pressure, so that a young musician finds support without becoming dependent on commercial structures.

Identity, finally, is multidimensional and flexible in SOLIS, not one-dimensional and decreed. A person can understand themselves at the same time as part of their region, their profession, and the world, without these levels coming into conflict, and identity may grow instead of being fixed from above. Thus culture becomes a bridge that creates trust and shared values, makes

dialogue between generations and groups possible, and gives orientation especially in times of change. Diversity is a strength here, as long as it is not artificially misused to divide. Culture is free and not for sale, and identity grows and is not decreed.

TECHNOLOGY, ARTIFICIAL INTELLIGENCE, AND THE FUTURE

In the assembly, the system presented three ways in which the region could harden its grid against the next solar storm, with costs, risks, and how much land each option would eat up. A second system had been instructed to argue against the obvious option, and did it well. The cook asked whether the question had been put correctly: whether this was about the grid or about the people who would be sitting in the dark. The machines had nothing to say to that. That was the moment the assembly began to work.

human beings have always built tools to help them, from the hand axe to the quantum computer. But every tool asks a question: who is serving whom here? Does technology free people, or does it make them dependent? Does it create prosperity, or does it deepen inequality? Does it make work easier, or does it take away its meaning? Never before have these questions been so urgent, because never before have humanity's actions determined its own future as deeply, as quickly, and as irreversibly as today. SOLIS faces them and draws one conclusion. Technology is not fate. It is not an unstoppable current that sweeps us away, but a tool whose use we decide on.

FUTURES RESEARCH AND SCENARIO PLANNING

Climate change, artificial intelligence, biotechnology, the opening up of space, and the shift of power between the world's regions are shaping a future that can no longer be left to chance. A good society therefore does not only look into the future. It shapes it consciously, ethically, and prepared. To this end, SOLIS maintains its own institutions that think ahead continuously: institutes and research networks that analyse technical, social, and ecological developments and draw up scenarios from them. What happens when artificial intelligence reaches a new level? What would be the consequences of far-reaching automa-

tion? In this work, science, enterprises, and the citizenry come together, so that the best minds think ahead jointly.

What is decisive is that this futures research does not happen in secret. There are no shadowy circles that decide everything in advance. Scenarios and analyses are made publicly accessible, taken up by schools and the media, and fed into citizen participation, so that society as a whole thinks along and sets priorities. A town holds a futures forum every year, at which citizens learn about coming developments, argue with experts, and contribute their own ideas. New technologies are therefore assessed technically, ethically, socially, and ecologically, and the public debate is held before a development gets out of control, not only afterwards. Thus the great upheavals are not suffered but shaped together: out of responsible foresight instead of fear of the future.

TECHNOLOGY AS A TOOL

In SOLIS, powerful technologies, artificial intelligence, robotics, and biotechnology, are ethically examined and actively steered. Every new technology is questioned about its economic benefit and equally about its social, ecological, and psychological consequences. Procedures such as altering the genome, quantum computing, or neural interfaces are not left to market forces alone. Ethical guidelines and public debate accompany them. Dedicated institutions, technology councils as expert bodies, the ethics councils, and citizens' forums, share in deciding what is developed, what is introduced, and what must be halted or changed.

Whatever serves the common good is supported by the funds: an application that makes learning easier for disadvantaged children, a storage system that carries the energy transition. Whatever only exploits attention without contributing anything is limited.

Above everything stands a clear basic attitude. Technology should make people stronger, freer, and more creative, not weaker, more dependent, and more uniform. The human being remains sovereign. Machines do not steer people. People steer machines. Algorithms do not write the laws. People write algorithms that respect the laws. Biotechnology does not determine the future of the species. People decide which interventions are ethically justifiable. What we decide in the coming decades helps determine whether humanity slides into a world of surveillance and dehumanization or rises into a world of possibilities and new forms of meaning. SOLIS takes the helm. It uses technology without letting itself be used by it.

ARTIFICIAL INTELLIGENCE AND HUMANITY

Artificial intelligence is no ordinary tool. It is able to learn, improves itself, may become autonomous, and may be more powerful than any human institution. In conventional systems it is seen either as a pure means of efficiency or feared as a threat. SOLIS takes a third path. Artificial intelligence can be a participant in the development of humanity, but it may never rule, replace, or incapacitate human beings. It is meant to support and strengthen them.

Clear ethical limits apply to this. Artificial intelligence may take on tasks that are too complex, too dangerous, or too monotonous for people, but never the final responsibility over life, dignity, and freedom. It may not wage war on its own, may not manipulate anyone unnoticed, and may not replace any human relationship. An artificial intelligence in a hospital can allocate beds and resources, but it does not decide on its own about a life-saving treatment. That decision remains human. Especially powerful systems are subject to strict, collective, and international oversight and are never controlled by individuals, enterprises, or single orders alone, a direct application of the order of power that permits no top and no monopoly over a central resource. Provision has been made for the extreme case. Every powerful system has a switch that people hold, and the ability to stop it is practised like the emergency itself.

Wherever artificial intelligence acts in public areas, in administration, education, health, or the courts, it must be able to explain its decisions. There may be no black box whose logic no one understands. Those affected have a right to inspection, to explanation, and to objection, and independent bodies review the systems regularly. Thus the separation of knowledge and decision is preserved, and the human being keeps the last word. Above all this stands a broad public conversation about how far artificial intelligence may go and what makes us human, held throughout society and not only in expert bodies, so that the most powerful tool in history does not become the master of its creators.

◆ THE HUMAN ABOVE THE MACHINE

That the human being keeps the last word is easy to state as a principle and hard to secure. An artificial intelligence far superior to humans can dominate them without ever giving an order: by pre-sorting the situation, selecting the options, and preparing the decision so that in the end all that remains is a nod. SOLIS meets this silent capture with firm safeguards. For every far-reaching decision, the system does not present one recommendation as if there were no alternative, but several genuinely different paths together with their trade-offs. A justification that even a layperson can check takes the place of blind trust, and review systems appointed specifically for the purpose have the task of arguing against the obvious recommendation. Above all, however, the framing of the question remains reserved to humans, the determination of what is at stake and what counts as success. The machine illuminates the answer. The human asks the question.

THE DIGITAL COMMONS

The digital sphere is the nervous system of modern society. Almost everything runs through networks, data, and algorithms today: communication, the economy, knowledge, and power. In many of today's systems, this nervous system is privately controlled. A few corporations control the platforms, data are exploited like raw materials, and algorithms decide invisibly what we see and think. SOLIS, by contrast, understands the digital

order as public infrastructure and not as private property. It serves people, not the other way round.

The basic digital infrastructure is therefore a common good. Networks, data spaces, and basic technologies are open to all, managed and secured collectively, dominated by no monopoly, and access is a right and not a privilege. A person in a remote region receives the same basic digital provision as someone in a big city. Linked to this is control over one's own data. Every person decides for themselves who may use their data, there is no secret exploitation and no trade in what is private, and whoever uses an application keeps control and can see and revoke at any time what is happening. To this is added digital transparency. Public data platforms make projects and decisions traceable, algorithms that affect the community are disclosed and open to review, and control lies with society and not in the dark, so that every citizen can understand how a public allocation procedure decides. Thus the digital nervous system is freed from private control: no exploitation of data, no invisible steering, no technology that rules over people. The digital belongs to everyone, data belong to the individual, and technology serves people and not power.

◆ ASYMMETRIC TRANSPARENCY

The openness on which this order relies carries a danger within it. The same infrastructure of data and sensors that makes power transparent could expose the citizen. Pointed in the wrong direction, transparency would become a panopticon. SOLIS therefore deliberately reverses its direction. Full transparency applies to power, to the offices, the funds, and the algorithms, while the life of the individual is protected by privacy. Privacy is a

right, data minimization a rule, and each person remains the master of the data about them. Whoever exercises power over others becomes visible. Whoever only lives their life remains hidden.

TRANSHUMANISM AND CONSCIOUSNESS

The history of humanity is a history of extension, from the tool that lengthens the hand to the computer that accelerates thinking. Now, however, we stand at a new point, at which technologies no longer change only what we use but what we are: neural interfaces, implants, interventions in the genome, assistance systems closely connected with us. SOLIS faces this future neither naively nor fanatically. It faces it in the awareness that it is opportunity and risk at the same time and demands the utmost care.

Technologies that extend body and mind are therefore examined strictly on ethical grounds, without a blanket ban but without naive enthusiasm. Every new possibility is examined in many dimensions, technically and medically as well as ethically, socially, and philosophically, and may be introduced only if it guarantees safety, respects dignity and identity, and preserves fairness. An implant that gives a blind person back their sight is supported. An intervention that would give a wealthy minority mental superiority is slowed down, because it entrenches inequality. It follows directly that there may be no compulsion to be enhanced and no two-class society. Participation, dignity, and rights never depend on technical improvements. Whoever does not want to be

enhanced remains a full member of the community. No job and no opportunity may be tied to an implant, and no child may be disadvantaged because their parents decided against an intervention. Here the absolute floor of fundamental rights takes effect. Dignity comes before any optimization.

Because these questions touch on how human beings understand themselves, their relationships, and their mortality, philosophical and ethical reflection accompanies every shift of the limit. Research into whether consciousness can be digitized or extended is not dogmatically forbidden either, but it is conducted with the utmost respect for identity and meaning and bound to clear limits that prevent misuse and alienation. The question of whether we should do something is always taken as seriously as the question of whether we can. Thus humanity can grow at this threshold without losing itself.

SPACE RESEARCH AND INTERPLANETARY ETHICS

For thousands of years, human beings have looked up to the stars with longing, and today this gaze is no longer a dream. Moon bases are being planned, missions to Mars prepared, the mining of raw materials on asteroids developed. This raises the question of how humanity deals with this new stage. SOLIS gives a clear answer. Space does not belong to individual nations or corporations but is a shared heritage and an extended living space of all humanity. Research in space is therefore conducted internationally, cooperatively, and peacefully. Large projects are

joint missions of many orders and disciplines, not races, scientific exchange and open invention come first, and the military use of space is ruled out. The mining of raw materials is permitted only under clear ecological, ethical, and fair rules. The consequences are examined and limited, the yields benefit the whole of humanity through joint funds and not only those who get there first, and the planetary level secures approval and oversight. A consortium that wants to open up an asteroid must therefore show that there is no ecological risk and that part of the yield flows back into common goods.

Space, moreover, is more than a store of raw materials. It is a possible living space and perhaps the home of other forms of life. SOLIS therefore considers from the outset how to deal with possible extraterrestrial life, how to prevent organisms from being carried in either direction, and how fair participation is kept secure. Ethicists and philosophers therefore work in the research teams too, there are clear protocols for dealing with the unknown, and humanity appears as a united civilization and not as a quarrelling crowd of competing groups. Thus it goes into space not as a reckless conqueror but as a learning and responsible species.

RISK AND DISASTER MANAGEMENT

A society that builds only on good times builds on sand. Natural disasters, global crises, technical dangers, and threats from space are part of the reality of a connected and technically complex civilization. SOLIS does not accept this fatalistically. It

acts. Risks can never be avoided entirely, but one can prepare for them and build systems that are robust, able to learn, and adaptable.

This includes structures that monitor and assess risks continuously: interdisciplinary teams from science, technology, and medicine, early warning systems that evaluate large amounts of data in real time, and systematic scenario planning. It is not an exercise in fear. It is the basis of targeted preparation. If such a system detects an unusual threat early, assessments are drawn up within hours, the stages of Earth Defence are declared, and resources are redirected. Disaster protection is a shared project and not national egoism. Early warning systems are connected internationally, emergency plans exist at every level, and aid networks are prepared, rehearsed, and equipped before the emergency occurs. If a solar storm threatens the power grid, the distributed energy supply absorbs the failure, and connections secured several times over hold the community together.

Resilience, however, is more than technology. It is social, psychological, and ecological at the same time: strong communities and neighbourhoods, informed and composed people, and landscapes and towns that can cushion crises. After a disaster, people can therefore draw on material help and equally on community structures that carry them emotionally. Thus people feel not like helpless victims but like co-responsible members of a resilient society that emerges from strain stronger than before, true to the resilience that belongs to the foundations of this order.

HUMANITY'S PLACE IN THE COSMOS

At the end of all technology and all systems stands not only the question of what we can do but the greater question of who we are and what we want to be: for ourselves, for one another, and for the universe. SOLIS answers it not with arrogance but with humility. We are not the masters of the universe and not the crown of creation. We are part of an immeasurably large and still largely unknown whole. And it is precisely from this insight that a great responsibility grows. The old logic held that what we can take belongs to us and that whoever is stronger decides. SOLIS reverses this logic. Where we use resources beyond the Earth, we do so as careful stewards and not as blind exploiters. Where we encounter other life, we come not as conquerors but as attentive fellow players. Where we explore the cosmos, we do so aware of the fragility of all that lives. Our significance is measured not by power but by responsibility, and not by what we take but by what we contribute.

Technical progress and expansion are meaningful only if they go hand in hand with inner growth, with wisdom, compassion, and mindfulness. That is why SOLIS measures greatness not by expansion but by maturity. We do not settle worlds just because we can. We first ask what for. We develop technology that increases not only our reach but also our capacity for reflection. We build a culture distinguished not by its size but by its depth. A ship traveling for generations to a distant star would be not only a technical adventure but the question of how to carry community, meaning, and humanity across centuries. The great aim is not faster, higher,

mightier, richer. It is to become a civilization that gives the cosmos more than it takes from it, that carries culture, beauty, and knowledge outwards, that learns instead of only conquering, and that leaves traces that shine not only technically but morally. Perhaps we are the first known species that can decide consciously how it behaves in the universe. We should not squander this chance.

CHILDREN AND FAMILIES

Levi had been born in a birth centre, with a midwife who had known Mara since the third month, and afterwards Jonas had been off duty for half a year without anyone in the care team forgetting him. Now Levi was building a tree house with his class and doing sums voluntarily for the first time. Ida was in her time of orientation: three months by the sea with an enterprise that made nets, three months in a workshop that she left again after two weeks. No one wrote that into a CV.

hen a child comes into the world, it is not only a biological event. It is an act of hope, a moment in which a society renews itself, and an invitation to everyone to take on responsibility. Everything this work designs will be carried by people who are still children today or not yet born. Whether they can carry it is decided in their first years, in their families, in their schools, and in whether they have someone who listens to them. This chapter is therefore about the foundation on which every lasting change rests.

BIRTH AND EARLY CHILDHOOD

SOLIS does not understand birth as a purely private matter but as a shared task. Every child is valuable, not only for its family but for the whole of society. From the start, every expectant mother receives high-quality medical, psychological, and social support, antenatal care, obstetric care, and aftercare, regardless of her contribution, position, and place of residence, carried by a culture of care that lets women feel safe and respected. Because children do not grow up through their mothers alone, all the people close to them are included. Fathers, co-parents, grandparents, siblings, and chosen families find advice and support, and the diversity of family forms is recognized. A father receives not merely parental leave on paper but a network of help, so that he can be truly present at the start of family life.

Early childcare is a place of loving encouragement and not of mere custody. Small groups, trained professionals, and spaces for play, creativity, and attachment take the place of rigid timetables, and there is no pressure for early achievement, only offers oriented to the child. Because parenthood is often exhausting and lonely, no one stands alone. Family centres and midwives are fixed points of support, neighbourhoods organize mutual help, and obstacles of bureaucracy and scarcity are removed deliberately, so that even a young mother who can contribute little accepts support without shame. There are deep reasons for this. The first years of life shape the brain, the body, and the emotions, people who feel supported are better parents, and every child who grows up well is a gain for everyone. A society that already cradles a person's first breath in dignity and community shows that its members stand up for one another.

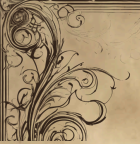

EDUCATION AND SUPPORT

Children are born learners. They ask why before they can speak, and they discover, feel their way, and play not out of compulsion but out of their own nature. SOLIS shapes education so that this innate joy in learning is not lost but preserved and strengthened. Today's school systems often try to bring all children at the same pace through the same content to the same examinations, and in doing so they overtax some and undertax others. Here children learn individually, at their own pace, with their own interests, and building on their own strengths. A child

who is fascinated by nature may research and experiment. A child who burns for numbers receives additional challenges without being labelled. A child who blossoms in art is supported as a full part of the community and not treated as second-rate.

In this education, mistakes are not a flaw but signs of where there is still something to discover. In place of the fear of bad marks and the division into clever and stupid comes the encouragement to try another way, to reflect, and to grow. Teachers are not mere transmitters of material but companions and mentors who smooth the paths of learning and support emotional, social, and creative development. This means less frontal teaching and more shared projects and work on relationships, and in the schools teachers, social educators, artists, and researchers work together in teams. Creativity, cooperation, and social intelligence stand on an equal footing with the classic subjects. Art is not a minor subject, teamwork is a key skill, and practising compassion counts as much as factual knowledge.

A single project shows how closely all this works together. When children build a tree house together, it combines the mathematics of statics and measurements, the biology of suitable trees and of nature conservation, the language of documentation, the design of art, and the ethics of cooperation and responsibility. The result is lively, practical learning that has nothing to do with isolated memorizing for the exam. Such an education sees the child as a whole person and brings forth the creative, reflective, and courageous people who can shape change. Above all, however, it connects with the maturity that the chapter on education establishes. It cultivates independent thinking and the ability to ask questions from the start, instead of drilling docility, because the

challenges of this century cannot be solved with a school from the century before last.

FAMILY STRUCTURES

The family is among the oldest and most powerful social structures of humanity, but it is not a rigid model. It changes with time, culture, and living conditions. SOLIS therefore understands the family not as a fixed template but as a living, flexible, and loving network, and it strengthens every form of family bond that is carried by care, responsibility, and affection, whatever it looks like.

This removes the invisible norm that in many of today's systems allows only one form of family to count as natural and merely tolerates all others. Same-sex parents, blended families, single parents, chosen families without biological ties, and households spanning several generations are recognized as equal, as long as they rest on care and mutual respect. There is no discrimination in rights and benefits, no moral judgment from outside, and no ranking between the traditional and the modern. At the centre stands not a social notion of morality but the well-being of the child. Support, education, health care, and care are oriented to what children and the people close to them actually need, and not to whether they fit a particular model. A single father has the same rights as a couple, a same-sex couple exercises parenthood jointly without bureaucratic hurdles, and a chosen family of adult friends who raise a child counts as a full family. In SOLIS, parent-

hood means responsibility, not ownership. Where parents fail, the community accompanies them instead of judging them.

So that families really have time for one another, working arrangements are conceived differently. Flexible part-time work, shared positions, sensibly limited work from home, parental leave for all genders, and support for relatives who provide care are not a luxury but a cornerstone of social health. A father can take several months of parental leave without endangering his path in the enterprise, and grandparents who spend a lot of time with their grandchildren count as a recognized part of the family network. The work of caring and raising children is not only valued more highly in cultural terms. As the economic order lays down, it counts as a contribution that earns value points and earned points, not as a private sacrifice but as a service for everyone. Thus the family is relieved instead of overburdened, and it is not a private building site that collapses under growing pressure but a value carried by the whole of society. A society that invests in its families builds up cohesion, resilience, and emotional health in the long run.

PROTECTED SPACES AND EMOTIONAL DEVELOPMENT

Children need more than education, food, and a roof over their heads. They need emotional security: spaces in which they may make mistakes, learn trust, express feelings, and develop resilience. In SOLIS, emotional health is therefore not a side

issue but a central aim. This includes stable, reliable people to whom children can turn with their worries without first making an appointment or going through official channels. Trusted teachers who are visible and approachable, key educators in the nurseries, and neighbourhood centres with open doors give children the certainty that someone is listening and takes them seriously. This reduces fear and helplessness and strengthens courage and a sense of agency. Added to this are programmes for resilience, mindfulness, and compassion that are a fixed part of everyday life, because emotional strength is not innate but grows when it is cultivated. Children learn early to recognize and regulate their feelings, to put themselves in others' shoes, and to argue fairly, and they experience that setbacks are part of life and how to deal with them in a healthy way.

Because the digital world is both a playground and a risk for children, media literacy is trained early. A child learns not only to operate a device. It understands how social media work, recognizes the difference between real information and manipulation, and grasps that approval online is no measure of its own worth, a direct continuation of the maturity that the work establishes elsewhere. If a child nevertheless becomes the target of bullying, it is not left alone. Structures intervene early, and in place of mere punishment comes real work on relationships, which strengthens the child affected and at the same time understands that the child who bullies often needs support too, the same restorative spirit that shapes the legal system. Thus SOLIS takes the heart as seriously as the mind, because emotionally strong children become reflective and compassionate adults who carry a healthy society.

YOUTH, IDENTITY, AND FINDING ONESELF

Youth is a phase like no other. Body and mind change quickly, and questions press in that were hardly there before: who one is, where one belongs, what one wants to do with one's life, and what freedom, responsibility, and meaning signify. In many societies this time is considered a problem phase, and young people are treated as a disruptive factor or as a risk that has to be controlled. SOLIS, by contrast, understands youth not as a threat but as a valuable time of transition, of searching, trying out, and growing, which deserves particular attention.

Young people need spaces in which to discover themselves without being judged or punished straight away, and SOLIS creates them: creative workshops, sports facilities, youth centres, digital platforms, and political and social projects to take part in. A youth centre therefore offers not only a billiard table but workshops for music, environmental projects, ideas for new enterprises, philosophy, and theatre, in which young people find out with their peers and with adults what moves them. Support in finding oneself happens without pressure and without disparagement. Young people have the right to ask, to doubt, and to reinvent themselves, and mentoring, counselling, and peer networks are aimed at strengthening identity instead of breaking it, in a climate of trust, respect, and freedom. And because the search takes time, the order expressly keeps time free for it. Between school and training lies a time of orientation in which young people may travel, help out, try things, and fail, without a CV punishing them for it.

In this time, sensitive questions also break open, for instance about sexuality, about one's own gender, about faith, and about political convictions. In SOLIS these questions may be asked and discussed openly, and young people have the opportunity to find their own voice in a protected and attentive setting with competent support. It is not about steering them in a predetermined direction, but about helping them find their own, fully in the spirit of the maturity and the flexible understanding of identity that the work sets out earlier. This is decisive, because confident and well-supported young people have better prospects of a fulfilled life, and a society that strengthens its youth gains creativity, inventiveness, and stability. Children and young people are not only future adults. They are already full members of the community with their own rights, needs, and dreams, they share in deciding what they need, and an order that recognizes this steers forward together with them.

IMPLEMENTATION AND TRANSITION

Mara's mother Rosa had been twenty-nine when the town by the river became a beacon: the first assembly with members chosen by lot, the first waterworks as a common good, the first winter in which no one was cold. Rosa often talked about the years before, when the cooperatives still stood beside the corporations and the town learned to live without their permission. She also talked about those who had left, and about the lawyer who wanted to buy up people's plots until no one would sell any more. "We didn't defeat them," she said. "We made them unnecessary."

n order like SOLIS cannot be introduced at the flick of a switch. A society cannot be reprogrammed overnight, all its fears and blockages cannot be argued away, and, this is decisive, such an order cannot be established by force either without betraying its own foundations. An order based on dignity and maturity cannot be installed by a coup. It has to be won through conviction and through the successful example. SOLIS is therefore a long, conscious transformation that requires time, patience, courage, and a culture of learning from mistakes. This chapter describes the path, the people who walk it, the resistance they will meet, the fate of old wealth, and the standards by which one can tell whether the path is still the right one.

THE PATH FROM WHAT EXISTS TO SOLIS

The path leads through three phases that interlock. At the beginning stands a change of consciousness, because before structures change, minds and hearts have to move. It takes honest assessments that make visible not only problems but also possibilities, and courageous voices in the media, the arts, science, and everyday life that dare to ask whether we really want to carry on like this. A film that tells the principles of this order, a series of conversations that brings citizens, experts, and activists together, teaching material that lets children talk about the future instead of cramming facts: that is how it begins.

This is followed by the building of beacons, concrete places and projects that show it can be done: towns that switch to a circular economy, enterprises that work according to these principles, schools and research networks that try out new paths. A small town switches its supply to renewable sources, introduces an assembly with citizens chosen by lot, and becomes a model that finds imitators. Such examples inspire, prove that change is practice and not only theory, and create momentum.

Only when enough people are convinced and enough examples hold does the change of the system begin: new legal frameworks, new economic incentives, new institutions. This too does not happen overnight but step by step, with setbacks, accompanied by monitoring and correction. A principle can stand in a constitution and still take years until administration, the economy, and society have internalized it. That is why accompaniment, monitoring, and feedback belong to every step. The transition to SOLIS is thus a project spanning generations, perhaps the greatest humanity has ever undertaken.

◆ THE HONEST ASSESSMENT

Two things must be said clearly here. First, this transition comes with no guarantee, and it meets not only inertia but real resistance. Second, and harder: SOLIS redistributes power and wealth. Whoever holds both concentrated under the existing order, together with the institutions built to protect them, will not be moved by arguments, because what is at stake here is not understanding but interest. A design that assumes the powerful can be persuaded is naive, and SOLIS makes no such assumption. It renounces coercion, but not realism. How it deals with this

resistance without betraying itself is the subject of the section on actors and resistance.

STAGES OF TRANSFORMATION

The transformation to SOLIS is not a sudden upheaval but a relay race, in which the stages build on one another and reinforce one another. The order is not arbitrary but follows an inner logic. Education comes first, because without the ability to think in complex ways, reflect ethically, and act creatively, every later reform comes to nothing. This education does not begin at university but in early childhood, and it prepares people to be able to shape change at all. It is followed by the economy as the most powerful lever. Incentives shift from short-term profit towards lasting, socially and ecologically sensible economic activity, and a changed culture in enterprises, participation, ethical aims, and responsibility towards society and the planet, takes the place of the pure logic of profit. When the economy changes, the order of power has to follow, so that political and institutional structures carry the change: more transparency, more ethical oversight, more participation, and gradually the bodies of the Ring that this work describes take shape. At the same time, work goes on on the soft factors, on values, stories, and the understanding of success, happiness, and meaning, because in SOLIS a successful person is not the richest but the one who creates something lasting for the community. In the end, a local project becomes a global process

that learns from one another, respects differences, and shares common principles.

For this to succeed, it takes road maps that set out stages, priorities, and responsibilities, accompanying educational and cultural programmes that make people participants instead of people affected, pilot projects with clear paths for spreading what has proved itself, and platforms through which knowledge and means are shared. Thus transformation does not become chaos but a conscious process carried jointly.

ACTORS, ROLES, AND RESISTANCE

The change to SOLIS does not happen by itself but is carried by people. Three roles stand at the centre. The pioneers are the courageous first ones who try out new ideas, often against the current and at risk: the social entrepreneurs, the municipalities, the teachers, and the artists who live out what at first is only theory and thereby create momentum. The bridge builders are less visible and yet indispensable. They bring together what would otherwise remain separate, citizens and politics, science and the economy, young and old. They translate between worlds and create spaces in which people with different interests work on solutions together. The guardians, finally, watch over ethics and law. Ethics councils, ombudspersons, and platforms for those who expose abuses ensure that the change does not proceed blindly or recklessly, protect the weaker, and hold SOLIS to its own standard.

◆ NOT ALL RESISTANCE IS ALIKE

Where there is movement, there is resistance, but it is not of one kind. Part of the resistance is a legitimate signal. It shows where people are afraid, where real conflicts of interest exist, or where someone has been overlooked. If a pilot project for sustainable urban development meets protest because rents are rising, that is no reason to abandon it but a sign that social compensation is missing. Such resistance is heard and translated into better solutions. Another part of the resistance, however, is not a signal for improvement but the defence of privileges by those who are losing power and wealth, and it does not dissolve through dialogue, because it does not rest on a misunderstanding. Treating both kinds as the same is the naivety on which great designs have failed. SOLIS distinguishes them and meets each in its own way. Not everyone will be convinced, and not everyone will come along. But everyone receives the opportunity to be heard and respected.

◆ BUILDING IN PARALLEL INSTEAD OF ASKING PERMISSION

Because the powerful will not give up their power, SOLIS does not wait for their consent. Its strategy is not to conquer the existing centres of power. It is to build parallel structures that simply work better, cooperative enterprises, supply from common goods, assemblies with citizens chosen by lot, open knowledge networks, and resilient, broadly based supply chains, and to let them grow until they overtake and absorb the old structures. The transition is thus won less by conquest than by obsolescence. Where the new order simply serves people better, the old one loses its hold. This is not a detour but the real path, because it does

without the coercion that SOLIS rejects and founds the new order on what it achieves instead of on what it conquers.

◆ THE DANGERS NAMED

This path can fail, and naming the dangers is itself a protection against them. The first is capture: that the new institutions are taken over by the very interests they were meant to replace. It is countered by the order of power, sortition, rotation, and the right of recall, which make lasting appropriation mechanically difficult. The second is economic strangulation: that an island of SOLIS, embedded in a hostile market, is starved or undercut. It is countered by the controlled membrane of the border and by building resilient, connected, and cooperative structures instead of isolated individual attempts. The third is hollowing out: that the language of SOLIS is adopted but its substance hollowed out. It is countered by the measurable monitoring of fundamental rights and by the maturity of citizens, which lets them recognize the hollowing out. The fourth is relapse: that the order erodes over time. It is countered by deep civic education and by the structural impossibility of ossification. A society that pays attention to these dangers is far harder to defeat by them.

◆ NO COERCION, BUT DEFENCE

Finally, there is a distinction that matters. SOLIS renounces attack and establishing itself by force. It is not installed through an overthrow and does not compel the unwilling. But renouncing coercion does not mean renouncing defence. A society that has built something just is not obliged to let it be destroyed, sabotaged, or hijacked in the name of tolerance. The line runs as in

the chapter on security: attack is forbidden, defence is legitimate. SOLIS protects what it builds against those who want to tear it down, without itself becoming the aggressor it rejects.

WHAT BECOMES OF OLD WEALTH

The hardest question of the transition is the one about what already exists: the millionaire's house, the corporation's capital, the plot of land that has belonged to a family for three generations, the loan a craftsman has taken out from a bank. A design that avoids it remains a sketch. SOLIS answers it with one principle and four rules. The principle is this: nothing is taken because someone has it, but nothing remains power just because it was once power. The transition does not expropriate but disempowers, and it does so where a citizenry has adopted the order, never from outside and never overnight.

The first rule concerns personal possessions. The house someone lives in, the workshop they run, the land a family farms remain theirs, as property or as a permanent right of use where the land itself becomes a common good. Whoever can no longer sell the land can still build on it, live on it, and pass it on to their children. The second rule concerns monetary wealth. It is exchanged into value points at a public rate, up to the threshold of provision. What lies above it is not lost, but it is transformed: into shares in the productive fund, which secure the former owner a return in value points for life, but no vote, no power of disposal, and no sale. Wealth is recognized as a claim to a good life and dissolved

as a lever over others. The third rule concerns companies. They become enterprises. The employees become participants, the management becomes an office held for a term, and the previous owners receive fund shares for their capital under the same rule as everyone else. Machines, buildings, and knowledge stay where they are needed, in the enterprise. The fourth rule concerns debts. Debts between people and enterprises within the order are settled in value points up to a fair limit and are extinguished beyond it, because an order without interest cannot carry on interest-bearing debts. Debts to the outside world remain what they are and are serviced through the membrane as far as possible, so that the new order does not begin as a cheat.

These rules apply in phases, like the provision for old age: with a long period in which both systems run side by side, and with guaranteed minimums for those who planned their lives under the old order. And they apply together with the right to leave for anyone who would rather be rich than ringed. Whoever leaves takes along what they can carry and leaves behind what belongs to the order: the land, the water, the power. Thus the transition becomes neither a robbery nor a capitulation to what exists. It is the translation of old wealth into a language in which it no longer rules anyone.

COMMUNICATION AND PERSUASION

No idea, however good, lives without communication, because people have to understand what it is about, feel that it

concerns them, and see that they can take part. In SOLIS, communication is therefore not an appendage and not an advertising machine, but a heart of the transformation. It connects, explains, inspires, and moves.

Above all, it explains not only what is happening but why. Too often today, reforms are pushed through and laws passed without people grasping their meaning, which feeds mistrust and withdrawal. SOLIS therefore always also answers the questions about what for and why. When a town switches to renewable energy, it is not only the technical details that are communicated. It is explained why this change is necessary, what it means in the long term, and what role each individual plays. This communication is addressed to everyone and not only to elites, to the woman worker, the young person, the pensioner, and the single mother as much as to the businesswoman, in clear, respectful language and without the jargon of experts. It uses every channel, from classic media through digital ones to local events and the means of art. A change in a town therefore does not begin with an administrative decree but equally with a festival of music, conversation, and shared experience.

What is decisive, finally, is that communication takes the form of dialogue and does not run from the top down. It is not about proclaiming messages but about creating spaces in which questions can be asked, doubts voiced, and proposals made. In them, those responsible speak with the population and not about it, openly also about mistakes and uncertainties, without back rooms and without secrecy. A new law is therefore not only explained. There is an open phase in which citizens ask questions, help shape it, and voice concerns. Thus a society arises that does not suffer change but carries it together.

INTERNATIONAL SPREAD AND ADAPTATION

SOLIS is not a finished template to be laid over the world, because every society has its own history, its own symbols, and its own resources, strengths, and wounds. It therefore does not see itself as an export product but as an open, adaptable model. It offers foundations and an ethical framework, but the concrete form arises locally. The five foundations remain the same everywhere. They form the backbone, which is not negotiable. What differs is the how. Which institutions are built, which paths are chosen, and which symbols and rituals carry the system depend on the society concerned. In an Indigenous community, the protection of traditional knowledge systems stands at the centre, in a post-industrial conurbation social and technical invention, in a region scarred by war first the building of resilience, before the bodies of the Ring arise. Thus every society fills the framework with its own reality instead of having a foreign model imposed on it.

So that SOLIS does not break up into isolated islands, networks connect the individual paths. Through them knowledge is shared: which approaches have proved themselves, where there were setbacks, and what can be learned from them. Means are distributed so that poorer regions also receive the same opportunities, and standards are coordinated, so that the ecological and human rights principles apply everywhere, even where they are implemented differently. A network of communities that live according to SOLIS exchanges experience on every continent, carries out joint projects, and shares lessons without levelling local particularities. How a world order arises from many such orders

without a ruler emerging above it is set out in the following chapter.

BY WHAT THE PATH CAN BE MEASURED

An order that bears its name but has lost its substance is the third of the dangers named, and only one thing helps against it: standards by which one can check at any time whether a project is still SOLIS or only called so. They are simple, and anyone can apply them. Is basic provision secured for everyone, and does the monitoring of fundamental rights measure how they are honoured in everyday life? Does every body that exercises power have a part filled by lot, a limit on terms of office, and a right of recall? Are decisions, flows of money, and exertions of influence open to inspection, and is the life of the individual at the same time protected by privacy? Is it impossible for anyone to accumulate value points beyond the threshold, is the quantity of points a public figure, and is capital allocated through several independent routes? Are ecological costs included in every price, and does the community take less from the planet than it gives back? Does education teach people to question the order itself, and is criticism of it expressly protected? May those who do not want to stay leave?

Wherever one of these questions has to be answered with no, the path has been abandoned, however much it may still sound like SOLIS. Wherever all of them can be answered with yes, it is SOLIS, however different it may look from this book. For what makes this order is not its form but what it secures: a power that

belongs to no one, a prosperity that excludes no one, a planet that stays habitable, and a human being who is free to examine all of this.

WORLD ORDER: SOLIS AMONG THE PEOPLES

Mara's cousin Tomas had left ten years earlier, for an order in which one could become rich. He came to visit every summer, with presents that no one here could buy, and with a gaze that lingered on the river a little longer each year. That same summer, Mara sat as the region's delegate in the assembly of the countries when the planetary defence reported its annual exercise: a chunk of rock two years away, three orders aiming together. None of it belonged to anyone. That was the point.

he greatest dangers of this age respect no border. Climate change, a new epidemic, a technology run wild, and a threat from space strike humanity as a whole and cannot be averted by any single country. An order conceived only inwards would therefore remain incomplete. This chapter asks how SOLIS relates to the world: how many societies work together without a new ruler arising above them, and how humanity carries what is planetary together without giving up its diversity.

THE RING AT THE PLANETARY LEVEL

The obvious answer to global problems would be a world government, and it would be the most dangerous top of all. What holds for the individual state holds all the more for the planet. Where a highest authority arises, the highest target for capture arises, and no distance would make it safer than any throne before it. Here too, SOLIS chooses not the pyramid but nesting. The order is built in many layers, from the neighbourhood through the region and the country up to the planetary level, and each level is itself a ring: with an assembly, offices, an ethics council, courts, and a review body, partly chosen by lot, with changing membership, open to recall, transparent, without a top. Above this stands the principle of subsidiarity in its strict form. The higher level may do only what the lower one truly cannot. Only what is truly planetary

is thus left to the planetary level. Everything else belongs closer to the people. Thus global coordination arises, but no global ruler.

WHAT IS PLANETARY AND SUCCEEDS ONLY TOGETHER

Some tasks, however, only humanity as a whole can solve. The climate knows no border, a pathogen leaps over every wall, a powerful artificial intelligence in a single hand endangers everyone, and an asteroid does not distinguish between nations. For these few but decisive cases, SOLIS creates a planetary defence: shared early warning, shared capacities, shared rules. The Earth Defence of the individual orders flows together in it, and it is itself ringed in turn and belongs to no single power. Protection against the end of humanity is the one task that no sovereignty may keep for itself, and at the same time the one that no power may misuse as a pretext for its own rise. The planetary defence therefore also stands under the lot, rotation, and accountability. The commons that belong to all, the atmosphere, the oceans, the heritage of space, are managed at this level, by the same rules as the waterworks in the region.

GLOBAL JUSTICE

A shared planet demands a shared justice. The goods that belong to everyone may not be captured by a few. Their yields benefit all of humanity, not only those who get there first. Where wealth rests on past injustice, redressing it is part of justice, not as eternal guilt but as an honest reckoning. Wealthy regions bear a particular duty, because responsibility is measured by abilities and means. And no society may found its prosperity on exploiting another. In SOLIS, diversity is a strength to learn from, not a pretext for inequality between peoples.

BELONGING AND MIGRATION

Who belongs to a community, and how one joins or leaves it, touches the core of every order. SOLIS holds two things together here. On the one hand, the right to leave. No person is chained to an order, however just it may be. Whoever wants to emigrate or found a community of their own that lives differently may do so, limited only by the rule that no one may leave in order to harm others or destroy the community. This is the controlled membrane applied to people. It lets legitimate difference pass and seals only the leak through which someone would undermine the order from outside. On the other hand, the right to come. Migration is not treated as a threat but in an orderly and humane way, with respon-

sibility towards those who seek protection as well as towards the communities that take them in. Whoever comes receives basic provision and fundamental rights from the first day, and access to language and contribution instead of to waiting rooms. Whoever takes people in receives the means to make it work. Integration is not a one-way street. Both sides learn, and diversity is respected, but not at the expense of the five foundations. An order that one may leave has to convince through what it achieves, and not by bolting the exit.

SURVIVING IN A MIXED WORLD

SOLIS does not arise in an empty world but alongside powers that do not share its principles. A society that binds itself ecologically and ethically while others do not can be overrun or undercut before its example takes effect. **SOLIS** meets this neither by retreat nor by attack, but by union: alliances of like-minded regions, mutual defence, resilient and connected supply chains, shared knowledge. Towards the outside world, it stands for a world of many poles. No bloc may dominate all others, regions and cultures remain independent and at the same time connected, and balance arises from mutual dependence, respect, and clear limits: diversity without chaos, order without subjugation. Its path outwards is the same as inwards, victory through obsolescence. Where the new order visibly serves people better, the old one loses its hold. Until then, **SOLIS** protects what it has built without itself becoming the aggressor.

A HUMANITY UNITED, NOT UNIFORM

The aim is neither a world state nor a patchwork, but a humanity that is united but not uniform. The five foundations apply everywhere, dignity, balance, responsibility for the planet, the advancement of knowledge and wisdom, and long-term resilience. They are the shared core, which is not negotiable. What differs is everything else: the shape of the institutions, the language of culture, the paths to meaning. As little as SOLIS prescribes a single idea of the good life, so firmly does it hold on to what all people share. A narrow, firm core and above it a rich diversity: that is the order in which humanity can act as one without ceasing to be many. Our future belongs to everyone, or it belongs to no one.

CHAPTER

14

SUMMARY AND OUTLOOK

THE FIVE FOUNDATIONS AT A GLANCE

At the end of this work, it is worth asking what SOLIS actually is and what distinguishes it from other designs. The answer is this: SOLIS is not a rigid law, not an unchangeable manifesto, and not a finished model to be imposed on a society. It is a learning, evolving system, a framework, an attitude, a compass that every society and every generation must fill with life anew. For all its flexibility, it is held together by the five foundations, which run through every area like a common thread and form its ethical backbone.

The dignity of the human being demands not only that no one be harmed but that we actively ensure that every person can develop. It is the absolute floor below which no weighing reaches, and it applies even to those who have become guilty. The balance of individual and community holds together what other orders play off against each other. Freedom without responsibility is reckless, responsibility without freedom is oppression, and true freedom arises where people recognize their responsibility and fulfil it out of conviction. Responsibility for the planet makes the Earth a living world that is not merely damaged less but healed, and gives it a voice in every decision. The advancement of knowledge and wisdom grounds the order in the best available knowledge and in the judgment that knows how to interpret it, and in the principle that all knowledge is open and every authority may be questioned, including this one. Long-term resilience,

finally, builds everything that has to bear weight in a distributed, learning, and adaptable way, so that the order emerges from strain stronger instead of breaking under it.

These values would remain without consequence, however, had the work not given them institutions. The hardest question, that of power, SOLIS answers not with a supreme body but with a Ring without a top, anchored in the people and secured against lasting capture by sortition, rotation, recall, and the separation of knowledge from decision. The economy it neither abolishes nor plans omnisciently. It limits the market: basic provision as an entitlement, discretionary goods through a means of value that cannot be hoarded, whose prices arise from decentralized signals within ecological and social limits, and capital that stays in many hands. The public sphere it protects not with a ministry of truth but with a procedure that has a burden of proof, a right of appeal, and the immovable limit that it may never be directed against criticism of SOLIS itself. And its citizens it forms not for docility but for maturity, up to the ability to reject the order itself if it deserves it.

THE BUILDING BLOCKS AT A GLANCE

Whoever has read the work knows its building blocks from their context. Here they stand side by side once more, so that every part of the design can be compared with every other, because an order only works if its parts do not contradict one another.

The five foundations are the non-negotiable core: dignity, balance, responsibility for the planet, knowledge and wisdom, and resilience. Everything else is freedom.

The Ring is the order of power: a circle of bodies without a top, anchored in the citizenry, at every level from the neighbourhood to the planet. Whoever is bound into it is ringed.

The assemblies pass the laws and budgets of their level, with members who are partly elected and partly chosen by lot. The offices held for a term carry things out, time-limited and rotating. The Council of the Wise thinks beyond the horizon and advises without commanding. The ethics councils examine against the foundations and can halt. The courts bind everyone, including the bodies of the Ring. The transparency and review body keeps knowledge open and monitors fundamental rights.

The citizenry decides four things itself: the adoption of the order, any change to its core, the recall of its bodies, and the questions put before it or brought to it by a petition. Everything else is decided by the assemblies.

The lot, rotation, recall, and the separation of knowledge from decision are the four components against capture. They apply to every power, including armed power, to the community bank, and to the allocation of capital.

The exception that ends itself allows fast action in an emergency: public, time-limited, with an expiry date, reviewed afterwards, and with the duty to dismantle.

The entitlements secure basic provision for everyone, housing, energy, food, health care, education, and mobility, without anything in return, funded from the community share. Where

goods of the base differ, need, order of registration, and the lot decide, not connections.

Value points pay for contribution and buy discretionary goods: tied to the person, interest-free, impossible to hoard, impossible to speculate with, with prices from decentralized signals within fixed ecological limits. Up to the threshold of provision they can be saved and bequeathed, beyond it not.

The quantity of points is a public figure. New points arise only in the community bank against registered contribution, and three open levers, the basic value of an hour, the community share, and the threshold, keep the quantity in line with the discretionary goods that are produced.

The community share is the part of every credit that fills the community funds, rising above a threshold. It takes the place of taxation, is simple at the source, and visible in its use.

Enterprises are communities of participants with an enterprise account that builds a reserve but no wealth. The meshed funds allocate capital through many independent routes, and a share is reserved for the dissenter.

The membrane is the controlled border with the outside world. It lets value pass for real needs and lets people with legitimate differences pass, and it seals the leak through which accumulation, power, or destruction would come in.

The translation of old wealth governs the transition: personal possessions remain, monetary wealth becomes value points up to the threshold and fund shares without a vote above it, companies become enterprises, and debts within the order are extinguished above a fair limit.

The stewards of the living world give ecosystems, animals, and future generations a voice before the bodies of the order.

Asymmetric transparency makes power transparent and protects the individual. Offices, funds, algorithms, and operations are open, and the citizen's life is private.

The limit on procedures applies wherever the order can intervene. Neither the review procedure of the public sphere nor the security apparatus may ever be directed against criticism of SOLIS.

The right to leave and the maturity to question SOLIS too are the final safeguards. An order that one may leave and reject has to convince through what it achieves.

These foundations and building blocks do not stand side by side. They connect society, law, security, the economy, the planet, education, health, culture, technology, the family, and the world into a whole. Therein lies the essence of SOLIS: no technocracy, no ideology, and no finished recipe, but a living whole, carried by people who know that freedom, responsibility, dignity, and sustainability strengthen one another. It is an order with a clear compass, which allows mistakes, learns from them, and improves itself.

WHY SOLIS IS NEEDED

One might ask why such a comprehensive design is needed and why it is not enough to repair the existing systems. The answer

is that humanity stands at a crossroads whose significance exceeds everything before it, and that this crossroads opens up in several dimensions at once.

In the planetary dimension, we have for the first time the means to make the planet uninhabitable, and at the same time the technologies to heal it. The only question is which direction we choose, and mere repair is no longer enough here. In the technological dimension, artificial intelligence, biotechnology, and neurotechnology are growing exponentially and can connect us as much as divide us. What decides is who steers them and who sets the ethical limits. In the social dimension, we have the knowledge to feed everyone, end poverty, and make education possible for all. Yet millions go hungry and inequalities grow, so that the question arises of how long we want to look on instead of creating systems that make this knowledge usable in a fair way. And in the psychological dimension, a world celebrates incredible progress and at the same time burns out inwardly. The question is whether we want societies in which people merely function or ones in which they flourish.

This is not a scenario of a distant future but the present. We already live in the midst of this ordeal, in a world that celebrates progress, entrenches injustice, falls apart politically, stands on the brink ecologically, and is exhausted psychologically. That is why it is not about small repairs or patchwork on systems that reached their limits long ago. It is about a new architecture, a new foundation, a new social contract that joins people, the planet, technology, and meaning anew. At the end stands nothing less than the question of how we as humanity can not only survive but flourish: how we create a civilization that grows, learns, and heals, on this planet and beyond. Time is pressing, because every

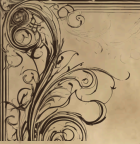

generation that hesitates pushes the responsibility onto one that may no longer have a choice.

THE GREAT VISION

SOLIS is more than a reform plan, a political agenda, or an economic concept. It is a vision, a comprehensive vision that is greater than any ideology, any party programme, and any national interest. It sketches a world in which every child has the chance to discover their gifts and no talent is lost merely because it does not fit a standard. A world in which no one goes hungry while others live in abundance, because wealth means not seclusion but shared responsibility. A world in which work brings fulfilment instead of exploitation, in which technology serves people and not the other way round, in which we work with nature instead of fighting it. A world in which cultures dance with one another instead of making war, and in which we look to the stars not as conquerors but as learning guardians.

Some will object that this sounds beautiful but is unrealistic, and that people are not like that. **SOLIS** answers this in two ways. First, this work has nowhere assumed better people. Each of its building blocks is built for the people who exist, fallible, self-interested, open to temptation, and it holds precisely because of this. Second, this vision is not a naïve dream but a standard, not a finished goal but a guiding light by which systems, decisions, and structures can be aligned. It is not about whether we create the perfect world. It is about whether we refuse to settle for less than

the best we can be. Such a vision fulfils three tasks at once. It gives hope, by showing that change is possible and the future can be shaped. It gives orientation, by helping to set priorities and assess decisions. And it gives meaning, by answering the question of why we take on the effort of change: because we will not accept a world in which inequality, destruction, and cynicism are the norm. Thus it stands like an inner star above the whole, giving orientation even in dark moments and directing our gaze beyond the next election cycle to the generations to come.

THE CALL TO HUMANITY

This section is not an analysis and not a theory but an appeal: to you, to me, to all of us. For it is not enough to wait for those at the top to put things right, to hope that politics and institutions will sort everything out, or to believe that a new strong man or a perfect programme will do everything for us. Nor is it enough to retreat into cynicism and hopelessness, to hide behind screens and irony, or to make oneself small with the thought that a single person cannot change anything anyway.

For society is not the government and not the system. Society is all of us, with our everyday decisions, words, and actions. Everyone can try out new paths in their own surroundings, live more sustainably, act more fairly, speak more attentively, connect with others and strengthen neighbourhoods and initiatives, start small projects, set conversations going, give a visible example, and pass on knowledge. This needs no saviour and no great leader, but

a critical mass of people who say: we want it different, we want it better, and we are starting here and now, with our means and in our lives. SOLIS is not a project from above but a network and a field of possibilities in which every movement, however small, becomes part of a great change.

Imagine it: in one town, a school begins to change its food, to allow more participation, and to teach mindfulness. In one neighbourhood, people begin to produce energy together and to bring public spaces to life. In one enterprise, the participants reorganize their working hours and share the proceeds more fairly. None of these projects changes the world on its own, but together they form a network that grows ever denser and stronger. The call of SOLIS does not want to burden you. It wants to show you that you are part of something greater, that you have a voice, and that you are not powerless. The question is not whether you can change everything, but whether you are ready to play your part, with courage, with heart, and with hope.

CLOSING WORDS

This work was not written for elites, academics, or conferences, nor for papers that gather dust in drawers. It was written for the people who work, love, suffer, and hope every day, often quietly, often unseen, often exhausted, and who sometimes wonder whether that was all or whether there is something greater out there that calls them and connects them with others. SOLIS is an

invitation to all who sense that there is more in them than everyday life allows, and who have the courage to think big and start small.

Mara does not exist. Nor does the cook, nor the river, nor the festival of lights. But everything that happens to them is built, block by block, in this book, and it is built for people as they are. That is the difference between a dream and a design.

A work that draws the line between advice and decision may not keep silent about that line when it comes to itself. This work was conceived and written by a human being. In the revision that distinguishes this version from the first, an artificial intelligence helped him. It looked for contradictions, named gaps, and suggested sentences. He examined, rejected, and took responsibility for every word himself. The machine illuminated the answer. The human asked the question.

So let this work be dedicated to those who are yet to come. May they grow up in a world that does not only protect them but nourishes and strengthens them. Let it be dedicated to the old, who gave us their stories. May we honour their wisdom and preserve their experience. And let it be dedicated to the living, who waver between fear and hope. May they recognize that they are not alone and that their longing for meaning and connection is not chance but a call. SOLIS does not want to be a dogma or a holy scripture, but a compass, a tool, a bridge, and a beginning. It does not invite blind following, but thinking, feeling, and acting together.

On paper, this book ends here. In truth, however, it does not end but begins: in minds, in hearts, in conversations, and in the actions that grow out of them. May SOLIS be a bridge and not a bunker, a light and not a watchtower of power, a promise and not

SUMMARY AND OUTLOOK

a command. For the children, for the old, for us, for the Earth,
for the stars, and for life.

SOLIS lives only if you live it.

System of Learning, Integrity and Sustainability
— SOLIS.
