CHAPTER

01

Foundation

The Dead End of the Established Orders

OVER THE COURSE OF ITS HISTORY, HUMANITY HAS PRODUCED SEVERAL GREAT DESIGNS FOR SOCIAL ORDER, AND EACH OF THEM ACHIEVED SOMETHING REAL.

Capitalism unleashed prosperity and innovation on a scale without precedent — and at the same time plundered the natural foundations of life and divided societies. Socialism took the promise of equality seriously — and, as actually practised, stifled freedom and inventiveness. Democracy gave people a voice — and reaches its limit where many voices turn into directionless noise that has no means of correcting itself. Autocracy demonstrated resolve and order — at the cost of the dignity and creativity without which no society stays alive.

None of these designs is simply wrong. Each has reached an inner limit that its own logic cannot carry it beyond. These limits stand out so sharply today because the conditions under which those orders arose have changed fundamentally. The great challenges of the present are no longer national, no longer separate from one another, and no longer slow. A changing climate, the concentration of wealth, the upheaval brought by digital technology, and the erosion of a shared relationship to truth interlock, reinforce one another, and unfold faster than established institutions can respond. An order built for a slower, more

bounded world can no longer reliably govern a connected and accelerated one.

Against this background, SOLIS sees itself not as yet another ideology, but as the answer to a sober analysis of what is missing. That answer comes down to four structural necessities.

First, we need an order that brings people, the planet, and technology into balance instead of subordinating one to another — not humanity above nature, not the machine above the human being, not the economy above everything else. Second, we need an order that does not maximize short-term gain but aims at durability, resilience, and shared well-being; growth that consumes the very foundations that make it possible is not progress. Third, we need an order that fosters innovation without abandoning its ethical limits — one that puts the most powerful tools of our time, from artificial intelligence to genetic engineering, in the service of human beings rather than handing human beings over to them. Fourth, we need an order that unites competence and conscience — not through coercion, money, or the accumulation of power, but through meaning and a shared sense of direction; the deepest transformations in history were never merely technical, but always cultural and ethical movements as well. The obvious objection is that such a design is utopian. Yet it rests not on the assumption that humanity will become better, but on the insight that carrying on as before is what is truly improbable. In a world whose ecological, technological, and geopolitical fate is shared, continuing the existing order is not the safe option but the riskiest of all. SOLIS builds on the resilient elements of human experience — inventiveness, ethical depth, and the capacity to think beyond one's own immediate interests — and assembles them into an order that can withstand the conditions of this century.

Humanity at the Crossroads

That the established orders are reaching their limits is not an abstract diagnosis. It shows in several crises unfolding at once, each serious in its own right; only in the way they are coupled does the full extent of the danger become visible.

The ecological crisis is the most fundamental, because it concerns the material precondition of every society. An economy that consumes re-

sources faster than they can regenerate, and that treats a stable climate as a free endowment, undermines the conditions of its own survival. No prosperity and no progress can be secured in the long run on a destabilized planet. The social crisis shows in a concentration of wealth and opportunity that hollows out the cohesion of societies. Where the gap between those who take part and those who are shut out grows too wide, the promise of equality before the law loses its tangible basis, and with it the trust on which every order depends. The technological crisis is of a different kind, because it changes not only our tools but human beings themselves. Today, digital systems shape what people perceive, how they judge, and where they direct their attention. Where these systems serve only to exploit attention, a quiet form of steering emerges that escapes conscious control.

The political crisis follows from the others. Where institutions can no longer cope with the problems, trust wanes; where trust wanes, simple answers gain power — answers that do not resolve complex situations but conceal them. Stable democracies begin to falter, and authoritarian models gain appeal because they promise the ability to act.

Finally, the crisis of meaning is the least visible, and yet deeply consequential. An order that addresses people above all as consumers, workers, and data points leaves unanswered a question that will not be silenced: what is all of it for? Without convincing answers to that question, the inner cohesion from which societies draw their resilience falls apart.

These crises cannot be solved one at a time or one after another, because each of them conditions the others. This is precisely the case for an integrated design: an order that treats ecology, economy, law, education, culture, and technology as separate departments will fail at the interfaces, where the real problems lie. SOLIS therefore does not begin with a single reform, but with the connections between the domains.

The Five Ethical Foundations

Every lasting order needs a base that lies deeper than its laws, its technology, and its institutions, because these change while the base has to bear the weight. In SOLIS this base is ethical, and it consists of five foundations. They are introduced here not as a creed but as working

principles: each of them rules out certain kinds of order and entails specific institutional consequences.

HUMAN DIGNITY

At the centre stands the human being as an end in itself, never as a means — regardless of origin, gender, age, belief, or ability. This does not mean that all human beings are the same, but it does mean that they are equal in worth. An order that takes this principle seriously may not divide people into the useful and the useless, and may not abandon anyone for being deemed unproductive. The institutional consequence is a basic security that does not depend on a person's employment history, and a body of law that protects the weak as well as the strong.

THE BALANCE BETWEEN INDIVIDUAL AND COMMUNITY

The human being is neither an isolated lone fighter nor a mere component of the collective, but a social individual who needs freedom in order to grow and community in order to flourish. The freedom of the individual ends where it destroys the common good; the common good may not be defined in a way that crushes the dignity of the individual. This balance is not static; it has to be struck again and again — which requires institutions that carry out exactly this weighing instead of settling it one-sidedly.

RESPONSIBILITY FOR THE PLANET

The Earth is not a backdrop and not a mere store of raw materials, but the shared world on which every society depends. This entails an obligation to use it only in ways that allow regeneration, to exercise the greatest caution when intervening in ecosystems, and to protect the natural foundations of life as a core task, not a side issue. This principle is not a moral afterthought but a condition of survival, and it is the reason why, in SOLIS, the natural foundations of life are placed beyond private ownership.

THE ADVANCEMENT OF KNOWLEDGE AND WISDOM

SOLIS bases its decisions not on power, money, or ideology, but on the best available knowledge, joined with ethical judgment. Knowledge without ethics can be destructive; power without knowledge is blind; only the two together can bear weight. This entails an obligation to ongoing research, to testing assumptions, and to open access to knowl-

edge — and equally the recognition that cleverness alone is not enough, but needs the foresight and humility we call wisdom.

LONG-TERM RESILIENCE

The worth of an order is proven not in calm times but in crisis. SOLIS is therefore built for resilience: able to learn, because it can correct itself; robust, because it is decentralized; adaptable, because it takes feedback seriously. In a future marked by ecological, geopolitical, and technological uncertainty, this order should not merely endure but emerge from strain all the stronger.

These five foundations are the standard by which every subsequent chapter can be measured. They are the compass that guides individual decisions, and at the same time the condition that turns many separate rules into a coherent order rather than a patchwork.

Method and Structure of the Work

The ambition of this work calls for a particular method, and it is worth setting that method out before the individual domains are developed.

The first methodological commitment is to pair every principle with an institution. A value that is not translated into a testable rule, a procedure, or an institution remains without consequence. This work therefore does not settle for describing desirable states of affairs; wherever possible, it names the mechanisms that make them last — including, and especially, for the case in which individual actors try to exploit the order. Whenever a principle is introduced, the question of its institutional safeguard must follow. The second commitment is to apply the order to itself, again and again. The hardest question for any social order is not how it governs its citizens, but how it limits its own power. SOLIS answers this question not with a supreme body of control that would itself remain uncontrolled, but by applying to its own institutions the same principles it lays down for society as a whole — transparency, separation of powers, accountability to the citizens, and protection against capture. This idea underpins the chapter on the order of power in particular, and it recurs throughout the work. On this basis, the structure of the work unfolds. This first chapter lays the ethical foundation. It is followed by the model of society with its order of power,

fundamental rights, and law; the order of the economy and resources; education and knowledge; health and well-being; culture and meaning; and the questions of technology, artificial intelligence, and humanity's place in the wider scheme of things. Then come implementation and the transition strategies that describe the path from what exists today to this order, as well as a dedicated chapter on children and families as the foundation on which every lasting change rests. A final chapter draws the principles together and looks ahead.

The domains build on one another, yet each can also be understood on its own, so the work can be read from start to finish or consulted selectively. It is not a text meant to reassure, but a design meant to be engaged with — written for everyone who believes that more is possible than merely administering what exists: an order that is fundamentally different and at the same time resilient.

THE NARROW CORE AND THE WIDE FREEDOM

One misunderstanding needs to be cleared up. That SOLIS rests on five non-negotiable foundations does not mean that it prescribes what a good life consists of. The foundations are a narrow, firm core; above it lies a wide freedom. What meaning, happiness, and fulfilment are, and which paths lead to them, is decided not by the order but by each person and each community for themselves. An order that prescribed this too would no longer be a framework, but a worldview raising itself to the status of law. SOLIS therefore strictly separates what holds for everyone from what belongs to each: a narrow, firm ground of the non-negotiable, and above it the whole breadth of human variety.

Society and the Order of Power

Fundamental Rights and How They Are Weighed

AT THE HEART OF SOLIS LIES A TWOFOLD PROMISE: the individual is free, and the individual is protected — part of a community that neither crushes them nor leaves them to fend for themselves. The promise sounds self-evident, and yet existing orders often fail at exactly this point. They guarantee rights that are complete on paper and empty in real life: a right to education where the schools are falling apart; a right to health that depends on wealth; a freedom of expression silenced by economic or algorithmic power. SOLIS draws a fundamental conclusion from this: rights are only as strong as their practical safeguards. It is not enough to proclaim them; they must be tangible, measurable, and enforceable in everyday life.

The fundamental rights that SOLIS guarantees include the right to life and to physical and psychological integrity; freedom of expression, belief, and conscience; freedom of movement, of assembly, and of choice in education and occupation; and secure access to the material foundations of a dignified life — water, food, housing, education, health, and participation. This last guarantee is not an act of charity but the condition for all the other freedoms: there is no freedom in starving, and no freedom in dying of a treatable illness for lack of means. Beyond human beings, SOLIS recognizes that the natural world we share has its

own claim to protection; the reasoning behind this is developed in the chapter on the economy and resources.

So that these rights do not remain abstract, they are anchored in procedures and institutions, and their actual state is continually assessed. An independent fundamental-rights monitor regularly examines how things really stand with people's freedom and dignity — not in the letter of the law, but in everyday reality. Where it finds that particular groups are systematically disadvantaged, targeted programmes are triggered to reduce the inequality. Guaranteeing a right thus includes the duty to verify that it is fulfilled. The hardest case is not the violation of a single right, but a conflict between two rights. Here it is not enough to appeal to wise judgment in the individual case, because that simply hands the real decision to the discretion of whoever makes it. SOLIS replaces this discretion with a procedure that has fixed limits. First, there is an absolute floor: human dignity and a person's physical and psychological integrity are not open to weighing. They form a threshold below which no good may be traded off against another; no appeal to the common good and no gain in efficiency justifies violating them. Above this threshold, conflicts are decided by a regulated standard of proportionality. Whoever wants to restrict a right bears the burden of justification — not the person whose right would be restricted. The mildest effective means must always be chosen. The decision must be justified publicly, is subject to review by the competent bodies — the ethics councils and the courts — and is recorded as a precedent, so that like cases are treated alike in future. Weighing thus becomes a transparent procedure with a firm floor, a clear burden of proof, and the possibility of review, rather than a matter of good will.

The Order of Power: the Ring

One problem recurs throughout the history of every form of rule: power tends to preserve itself, to strengthen itself, and to protect itself. It attracts money, influence, and networks of loyalty; it forms closed circles in which interests cover for one another. In the end, the integrity of institutions, the trust of citizens, and society's long-term capacity to act all suffer. An order that does not solve this problem, but merely moves it somewhere else, is not viable.

WHY THE RULE OF THE WISE FAILS

The obvious answer is to put the wisest and most upright people at the top, chosen through a careful procedure that tests for wisdom, lifetime achievement, and strength of character. This answer is seductive, and history has refuted it. Plato's philosopher-kings, the Chinese mandarin, the Leninist vanguard — each of these designs began with the promise of selecting the best and ended in the concentration of power. The reason lies not in the failings of individuals but in a structural weakness: wisdom and integrity cannot be measured objectively. Where an order makes them a criterion for selection, the selection procedure itself becomes the most valuable prize — and thus the target of capture. Whoever controls the filter controls the system. The demand that “we simply choose good people” is therefore not a solution to the problem of power, but a way of moving it to a place that is harder to control.

SOLIS draws a clear conclusion from this: instead of a more flattering description of those who govern, what is needed is a hard mechanism that withstands the very dynamic the order itself identifies. That mechanism is simple: there is no top.

THE RING INSTEAD OF THE SUMMIT

In SOLIS, there is no president or monarch at the top, no party and no machine. Power is not organized as a pyramid but as a ring: a circle of bodies that scrutinize one another, none of which is the final authority.

The Council of the Wise is one of these bodies, but not their summit. Its task is long-term, cross-disciplinary orientation — thinking beyond the horizon of the day's questions and supplying the other bodies with proposals and considerations. It advises, drafts, and warns; it does not command, and it does not decide alone. Its strength lies in judgment, not in reach.

The ethics councils act at every level — local, regional, and overarching — as bodies of normative review. They examine legislation and far-reaching decisions not only for legal and economic coherence, but for compatibility with the five foundations. They are drawn from many disciplines and hold strong powers of review and a suspensive veto: they can halt developments that fundamentally violate the values of the order — which gives them influence, not unlimited power.

The courts apply the law bindingly and equally to all. Crucially, they also apply it to the other bodies of the Ring; no office and no institution stands above the law.

Finally, an independent body for transparency and review secures the foundation without which the Ring cannot function: open access to information. It ensures that decisions, financial flows, and conflicts of interest can be traced, and it prevents any body from keeping the others in the dark by holding knowledge to itself.

These bodies check one another in a circle. None can act without the others, none stands above the others, and there is no point at which the chain of control ends. This is exactly where the break with the pyramid lies: where there is no top, there is no ultimate target for capture.

THE CITIZENS AS THE OUTER ANCHOR

A ring that only turns in on itself would remain a closed system. The Ring is therefore anchored below, in the people. The citizens are the one node that sits outside the institutional circle, and they hold constituent power: they can recall the bodies of the Ring, overrule them, and appoint them anew. The members of the Council of the Wise and of the other bodies serve on a revocable mandate; their authority is borrowed, not owned.

Here, however, lies a danger that SOLIS deliberately avoids. Pure, direct majority rule would bring back the very forces the order rejects from the outset: populism, manipulation, echo chambers, a clamour of voices without direction. SOLIS already has the answer built in. The power of the citizens is not exercised as a raw vote, but structured through the deliberative system of participation: informed, grounded in facts, and protected against manipulation. Before every far-reaching decision, citizens receive vetted and diverse information, access to expert forums, and tools for ethical deliberation; only on this basis is a decision made. The people's power thus remains the root of legitimacy without tipping over into populism.

In this way, two things come together that would not hold on their own. Power is a ring without a summit, the Ring is grounded in the people, and the people's power is filtered through deliberation. This is the order applied to itself: SOLIS governs itself by the same principles by which it lets society govern itself.

THE MECHANICS AGAINST CAPTURE

So that all this remains a mechanism and not just a principle, the Ring rests on four concrete components.

The first is selection by lot. Part of the oversight bodies is neither elected nor appointed, but filled by lot from among the citizens, in rotation, on the model of the ancient Athenian council or the jury. A lot cannot be bribed in advance; no career can be built on it; no stable cartel can form around it. It is the incorruptible element of the system.

The second is mandatory rotation with term limits. Power passes through many hands instead of settling in one place. Where no one stays in a post long enough to make it their own, nothing hardens.

The third is the right of recall and reconstitution. The Council of the Wise and every other body can be dissolved and newly filled by a structured, informed majority of the citizens. The guardians serve as long as their mandate holds, and no longer.

The fourth is the separation of control over information from the power of decision. No body may both determine what is known and decide what is done. The body for transparency and review ensures that the base of knowledge is shared and open, so that no node can dominate the others through a monopoly on information.

SELECTING THE COUNCIL OF THE WISE

These components also answer the question on which the rule of the wise founders: how can the Council of the Wise be filled without a hidden filter for wisdom becoming the object of capture?

SOLIS does without any body that judges the wisdom of candidates behind closed doors. Instead, it uses a multi-stage, open procedure. Candidates are nominated broadly and examined publicly — against disclosed and contestable standards: demonstrable judgment, lifetime achievement, and a proven capacity for responsibility, not an opaque score for “wisdom.” The decisive role in this procedure falls to a citizens’ panel chosen by lot, which itself rotates and therefore cannot be bought in advance. Final constituent power and the power of recall remain with the citizens. Terms are limited, mandates revocable. Wisdom is thus not certified once and for all; the Council remains continually accountable and replaceable.

AN ORDER THAT HOLDS WITH FALLIBLE PEOPLE

The decisive test of an order of power is not whether it works with good people, but whether it remains just with fallible, self-interested ones. The Ring is built on this assumption. It does not require officeholders to be wise and selfless; it requires only that no one can entrench themselves permanently. A circle without a summit, whose bodies are partly chosen by lot, rotate, can be recalled, and operate in the open, remains correctable even when individuals try to exploit it. SOLIS thus solves the question of power not by hoping for better people, but through a structure that withstands the human temptation to power — and it is exactly this that distinguishes a resilient design from a mere vision.

Law and Justice

A society is only as just as its law. Values give direction; without institutions that declare and enforce the law, they remain theory. In many existing systems, people experience the justice system as impenetrable and over-bureaucratic, as dependent on money and influence, and as geared toward punishment rather than repair. SOLIS counters this with a legal system that puts balance, not power, at its centre, and that joins ethics and law in a dual structure: the ethics councils formulate guidelines and examine whether laws are compatible with the foundations; the legal institutions apply the rules bindingly and equally to all. The result is an order that is not only formally correct but also morally grounded.

Law in SOLIS is accessible. It may not be a secret code that only experts can decipher. The essential rules, rights, and procedures are available in plain language, taught in schools, and easy to find online, so that anyone caught up in a conflict can see, without a long search, which rights they have, which steps are open to them, and where to find help. Law in SOLIS is also transparent: no judgment is handed down without a public justification, no procedure runs without reviewable standards. Those who judge disclose the criteria by which they decide, so that the people involved can understand why something was decided, even when they dislike the outcome.

In dealing with wrongdoing, SOLIS leaves the logic of retribution behind. Harmful conduct has consequences, but the emphasis lies on

restitution, healing, and addressing root causes. Someone who causes harm is not simply locked away, but drawn into a process that helps them grasp the consequences of their actions and involves them in putting things right; a company that breaches ecological standards does not just pay a fine but actively contributes to restoration. Repressive punishment often treats only symptoms; SOLIS targets the causes, because that is where lasting change lies.

Conflicts are resolved as early as possible and with the lowest possible threshold. The legal system is tiered: first come mediation and dialogue, only then the courts, and finally a last instance for questions of principle. A dispute between neighbours is settled by trained mediators before it escalates into a court case. The system is carried by judges and mediators who do not rise by the logic of career or power, but undergo a thorough ethical and psychological assessment, keep training throughout their careers, and are regularly reviewed; for a legal system is only as strong as the integrity, judgment, and empathy of those who apply it.

Above all stands the principle that ties the law to the order of power: no one is above the law — no officeholder and no institution, not even the Council of the Wise and not the ethics councils. Separation of powers, oversight, and review prevent arbitrary rule. Law is thus not a tool of the powerful but a shield for the weak: no class justice in which wealth buys its way out; no impenetrable procedures without justification; no law that only punishes instead of addressing the causes.

The Public Sphere, the Media, and the Question of Who Defines the Truth

Where societies fall apart, the collapse is almost always preceded by a loss: the loss of a shared grip on reality. Without a functioning public sphere that is both free and responsible, people no longer know what they can rely on; power elites shape the narratives unchecked, facts become weapons, and citizens drift either into indifference or into fanaticism. SOLIS counters this with a media order that is free not only in the legal sense, but also ethically grounded, transparent, diverse, and accessible. This order steers between two distortions and avoids both.

In authoritarian systems, the media become tools of control; in purely profit-driven systems, they become machines for harvesting attention, putting ratings above substance and division above understanding; and in the digital public sphere, monopolies of opinion arise that use algorithms to decide what gets seen. SOLIS therefore has neither state-controlled media nor a market that follows profit maximization alone. Media organizations work according to a verifiable ethical code; their ownership structures, financial flows, and conflicts of interest must be disclosed, because independence exists only where the media are free and at the same time accountable.

This raises the hardest question for any open society, and SOLIS does not dodge it. A free public sphere must be able to defend itself against targeted disinformation and manipulation that undermine democratic processes. Yet any authority with the power to decide what counts as false becomes the greatest danger in its own right — the gateway through which authoritarian encroachment has historically entered. The answer therefore cannot lie in a ministry of truth that rules on what is true and false, but only in a procedure.

This procedure rests on several commitments. There is no state censorship in advance. The standard response to false or harmful statements is counter-speech, context, and labelling, not removal. Where an intervention is nevertheless considered, it follows an adversarial procedure: a review panel partly chosen by lot decides; the burden of proof lies with the claim that something is false or manipulative; the reasoning is public; and the decision can be appealed. Above all stands an immovable limit: this procedure may never be used against criticism of SOLIS itself, of its institutions, or of its officeholders. Political dissent is protected without exception. It is precisely this limit that prevents the necessary defence against manipulation from becoming a tool for holding on to power.

Transparency applies not only to the media, but equally to state and economic actors. Decisions, financial flows, and conflicts of interest must be open to inspection; lobbying registers are mandatory and public; citizens have the right to know who influenced a decision, which data it was based on, and which alternatives were considered. Finally, digital platforms, as the central arenas of today's public debate, are

treated as part of the democratic infrastructure and not as a purely private matter: their algorithms must be disclosed and open to review, dissenting voices must have fair access, and the platforms too are bound by the procedures and protective limits described above.

The deepest safeguard, however, lies not in any body that intervenes, but in education. A population that has learned from an early age to check sources, compare perspectives, and recognize manipulation is the strongest defence against a distorted public sphere — and makes any intervening authority as unnecessary as possible. The aim of the media order is therefore not perfect control of information, but a mature society that refuses to be manipulated, judges critically and with confidence, and knows how to argue without tearing itself apart.

THE GUARDIANS AND THE INSTRUMENTS

Particular vigilance is owed to the measures by which the order gauges its own condition. The protection of fundamental rights can be monitored, yet every metric that becomes a target loses its meaning over time: where a number decides whether the order is judged healthy, the temptation grows to serve the number rather than the reality behind it. The hollowing-out then happens not through open attack but silently, while the gauge still reports good health. SOLIS responds in two ways: the measures themselves rotate, are set adversarially, and are deliberately called into question; and alongside measurable monitoring stands an unpredictable review carried out by citizens, which no one can prepare for. In this way, not only the guardians are watched, but the instruments too.

HOW THE ORDER CHANGES

For a learning order to change without losing itself, it needs a regulated way of changing its own rules. SOLIS distinguishes two levels for this. The non-negotiable core — the five foundations, the fundamental rights, and the load-bearing safeguards against capture — can be touched only under high hurdles: with a large majority, after extensive deliberation, with a waiting period, and across generations. Everything else can move more freely, through the deliberative system of participation. This joins two things that would otherwise pull apart: the

flexibility without which an order ossifies, and the firmness without which it gives itself up.

THE RIGHT TO LEAVE

The maturity this work grants its citizens includes the right not only to reject the order from within, but to leave it. No one who does not want to live under the five foundations is forced to stay. The right to leave is itself a safeguard: an order that people are free to leave has to convince them through what it achieves, not by bolting the exit. How this right is organized without becoming a lever for destroying the common good is discussed in the chapter on world order.

CHAPTER

03

Law and Justice

AN ORDER REVEALS ITS CHARACTER NOT THROUGH THOSE WHO FOLLOW IT, BUT THROUGH THOSE WHO BREAK IT. How it deals with wrongdoing is therefore not a side issue of law but its real test: this is where it becomes clear whether a society's principles still hold once they become inconvenient. SOLIS answers this question not with the reflex of retribution, but with a law that protects, restores, and preserves the dignity even of the person who has broken it.

THE LIMITS OF RETRIBUTION

The obvious answer to wrongdoing is retribution: whoever causes harm should suffer harm. It is an old and understandable impulse, and it falls short. The deed that is avenged remains done, the victim's loss remains unhealed, and the person punished returns, hardened by the severity they endured, to the very conditions that gave rise to the deed. An order that draws its security from punishment alone therefore produces not calm but repetition: overcrowded prisons, high reoffending rates, and whole groups shuttling between offence and confinement. From this SOLIS draws a sober principle: punishment is not an end but a means, and it is justified only by what it achieves.

RESTORATIVE JUSTICE

Retribution gives way to restorative justice. Its measure is not the harm inflicted but the harm healed, and it pursues three aims at once. First, redress for the victim: where harm can be made good, reparation

comes first, and the injured party receives real restitution rather than a symbolic verdict. Second, the offender's return: where an offence grew out of need, addiction, or illness, treating that cause goes hand in hand with the sanction, because leaving the cause untouched invites repetition. Third, the protection of others: deprivation of liberty remains the means of dealing with those who pose a serious danger, yet even it serves security and return, not revenge. Punishment is thus measured by its effect, not by its severity.

FAIR PROCEDURE AND EQUALITY BEFORE THE LAW

So that law does not become arbitrary, it rests on procedural guarantees that yield to no expediency: the presumption of innocence, the burden of proof on the prosecution, and the right to a defence, to be heard, and to independent review. Decisive, however, is a principle that sets SOLIS apart from every justice of rulers: the law applies equally to all, including the bodies of the Ring. The courts apply the same standards to the Council of the Wise, the ethics councils, and every officeholder as to any citizen; no office and no institution stands above the law. A law that spares the powerful is no longer law, but a tool.

OPEN ADJUDICATION OF THE FOUNDATIONS

The five foundations form the non-negotiable core of the order; how they apply in a given case does not. What dignity requires when two claims to dignity collide, or what responsibility for the planet demands against the freedom of the individual, is decided through interpretation — and interpretation is power. It follows that SOLIS entrusts the foundations to no closed circle of interpreters. Adjudication of the foundations is open and adversarial by design: hard cases are argued by representatives of the opposing sides before a panel partly chosen by lot; every decision is publicly reasoned and published together with any dissenting opinion; and precedent remains open to challenge. In the most fundamental questions, a citizens' panel chosen by lot takes part, so that the interpretation of the core stays anchored in the citizens. The foundations are thus immovable, yet their reading remains open to review; no one controls them as the last word.

DISPUTES AMONG CITIZENS

Not every wrong is a crime; most are conflicts. An order that forces every dispute straight into court turns people into adversaries and courts into factories. SOLIS therefore puts a first, low-threshold level in front of the formal courts: mediation and conciliation — local, swift, and independent of the parties' means. Only where agreement fails or rights are affected in principle does a court decide. Law thus remains accessible, and disputes end more often in a workable solution than in a winner and a loser.

THE LIMIT OF COERCION

Above all stands a limit that even the guilty retain. No punishment may violate human dignity; there is no torture, no degrading treatment, and no punishment that permanently excludes a person from the community. Every sanction is proportionate, limited in time, open to review, and aimed at the person's return. This limit is not a concession to leniency but a consequence of the foundation: the dignity that is unconditional in the first principle remains unconditional in the face of guilt.

Security, Defence, and Peace

IN THE END, EVERY ORDER RESTS ON A QUESTION THAT MANY DESIGNS AVOID: who controls force? Since Max Weber, the state has been defined as the entity that claims a monopoly on the legitimate use of force — and whoever controls that monopoly, over police, defence, and ultimate coercion, ultimately controls everything else, however carefully the other bodies are arranged. A Ring that distributes power but leaves force undivided would be a mere façade. Hence the principle of this chapter: security is not the exception to the order, but its sharpest application.

WHO HOLDS THE SWORD

The temptation is to create, in the name of security, an authority that stands above the rules — in an emergency, for everyone's protection, for a limited time. This is where almost every freedom in history has died, because exceptional powers, once granted, are rarely returned: the power meant to see a society through the storm outlasts the storm. SOLIS concludes from this that there may be no place where force escapes control. Here too, the answer to the old question of who guards the guardians is not a higher guardian, but the same as everywhere else: a structure in which no one can entrench themselves.

FORCE BOUND INTO THE RING

Four components bind force, just as four components bind political power. First, civilian oversight by bodies partly chosen by lot: the armed

services are watched not by their own kind, but by the citizens. Second, rotation of command and term limits, so that no lasting cartel and no personal following can form around force. Third, the separation of orders from their execution, and of command from review: whoever orders the use of force may not also judge whether it was lawful. Fourth, full traceability of every operation. Above these components stands an immovable limit: the order's force may never be turned inward against political dissent. Just as the intervention procedure of the media order may never be used against criticism of SOLIS, the security apparatus may never be used against those who oppose the order. This limit prevents the protection of the order from becoming the instrument of its ossification.

INTERNAL SECURITY WITHOUT A POLICE STATE

In SOLIS, security at home does not come first from surveillance and deterrence, but from tackling the causes of crime: where no one is driven into crime by need, exclusion, or hopelessness, crime falls before any patrol goes looking for it. Where protection is still needed, the principle of the mildest means applies: as little coercion as possible, and force only in response to force. The security services are part of the community, not an occupying force. Here the asymmetric transparency that runs through the whole work comes into play: full visibility falls on power — on every operation, every order, every means used — while the life of the individual remains protected by privacy. SOLIS thus reverses the direction of surveillance: it is not the citizen who is exposed and the apparatus that is hidden, but the apparatus that is exposed and the citizen who is protected.

EXTERNAL DEFENCE WITHOUT ATTACK

Towards the outside world, one distinction matters: attack is forbidden, defence is legitimate. SOLIS does not impose itself by force and subjugates no one, yet it is not obliged to let itself be destroyed in the name of tolerance. A society that has built something just may defend it without becoming the aggressor. This calls for a defence that is strong enough to deter and bound tightly enough not to become a threat itself: no machine that can wage war on its own, no weapon whose final decision over life and death does not rest in human hands, no armament outside

oversight. The capacity to defend exists, but under the same Ring and the same limit as every other form of force.

PEACE AS ACTIVE WORK

The deepest protection, however, is not an apparatus but the absence of reasons for violence. In SOLIS, peace is not a pause between conflicts but continuous work: defusing tensions early, remedying injustices before they turn into violence, and cultivating understanding across borders. What a society invests in prevention, education, and justice, it does not have to invest in weapons. SOLIS thus defends itself most effectively not by striking harder, but by removing the tinder from which violence ignites.

Economy and Resources

Property and Common Goods

PROPERTY IS ONE OF THE MOST POWERFUL AND AT THE SAME TIME MOST CONTESTED IDEAS IN HUMAN HISTORY. It has built societies and destroyed them, spurred innovation and fuelled wars, made freedom possible and legitimized oppression. Capitalism often treats property as freedom itself: whoever owns has power, security, and the ability to shape things. Socialism has often collectivized property, on the assumption that private ownership breeds inequality and destroys community — and has frequently ended in bureaucratic rigidity, a lack of incentives, and corruption in the administration. SOLIS does not swap one for the other, but seeks a new balance that uses the strengths of both principles and avoids their weaknesses: personal possessions remain inviolable, while the natural foundations of life are treated as common goods. In SOLIS, personal possessions are protected because they are part of self-determination. Your own house, your clothes, your tools, your savings, your books, your keepsakes, and above all everything you have made yourself belong to you; you may keep them, shape them, pass them on, and bequeath them. Possessions in this sense foster creativity, identity, and security: an artist keeps full rights to their works, just as a family keeps the right to live in the house it has built and to pass it on to its children.

The great foundations of life are a different matter: water, soil, air, energy sources, and raw materials. They cannot belong to anyone privately — because no one created them, because they are the condition for everyone’s survival, and because their misuse harms not only individuals but entire societies, ecosystems, and generations. In SOLIS, therefore, no company can acquire a water source and deny people access to it, no investor can buy up land and leave it idle for speculation while people cannot find housing, and no corporation can treat the air as if it were a commodity.

These common goods are managed collectively — and, in keeping with the order of power, not as state property, but through a combination of citizen participation, scientific expertise, and ethical review. Their use is regulated so that no one is starved out or exploited and future generations keep their access too. The tools for this are open platforms that show how much water, energy, or soil is being used where; sustainability standards that set how much may be extracted without harming the system; sanctions against the build-up of monopolies and shadow markets; and innovation programmes that promote sustainable use. SOLIS thus resolves the false choice between boundless private power that destroys the collective and total collective control that suffocates the individual. It grants freedom where freedom fosters creativity, innovation, and identity, and collective management where survival and sustainability are at stake. What grows from this is not only balance but trust: individuals know that they have their own space and security, and at the same time that the foundations of life will remain open to their children as well.

Money, Value, and Cycles

For centuries, money has been one of humanity’s central tools. It has made trade possible and triggered crises, fuelled innovation and plunged societies into poverty, promised freedom and created dependency. Under capitalism, money often becomes the measure of all things: whoever has it can buy influence, secure their safety, and help make the rules. Socialism has often suppressed or tightly controlled money, and in doing so frequently produced bureaucratic rigidity, scarcity, and black markets. SOLIS does not simply replace money with

a new means of exchange. It creates a two-part order with a clear separation between basic provision and discretionary goods.

BASIC PROVISION IS AN ENTITLEMENT, NOT A PAYMENT

In SOLIS, every person has a guaranteed entitlement to the foundations of life: housing, energy, food, health care, education, and basic mobility. These are not market goods; they are provided through planning, capacity, and shared contributions, and no one ever has to pay for them. A young adult is thus entitled to a basic home without having to give anything in return, and a family receives staple foods as an entitlement, not in exchange for payment. This secures a floor below which no one can fall, regardless of their employment history.

VALUE POINTS FOR DISCRETIONARY GOODS

Everything beyond basic provision is obtained with value points. They are tied to the person and bear no interest; they arise solely from real contribution — from work, care, raising children, innovation, and voluntary service; they cannot be hoarded or traded speculatively; and their relative worth reflects social benefit, sustainability, and scarcity. An engineer receives value points for working on an energy plant, a carer for looking after people day by day, an artist for their work. What matters is what sets such a medium apart from money: it cannot turn itself into capital that multiplies and translates into power.

HOW PRICES ARISE WITHOUT A CENTRAL PLAN

This is the hardest question for any economic order that pushes back the market, and SOLIS does not dodge it. A price is information. In a market it arises from countless decentralized decisions and signals what is scarce and what is needed. An order that abolishes the market must say how, without this signal, it intends to determine what things are worth — and history has shown that no central authority can calculate what a market computes. SOLIS does not claim this omniscience. It does not replace the market with a central plan; it sets boundaries for it.

For discretionary goods, relative prices in value points are not decreed from above but emerge from decentralized signals, in three layers. The first layer is the signals themselves: providers and consumers register supply and demand, and relative prices move with actual scarcity and actual demand. This preserves the information function of prices,

which a pure plan loses. The second layer is fixed limits: ecological costs are built into prices by rule, so that a flight across continents costs more points than a train journey, and an environmentally harmful product more than a sustainable alternative; at the same time, no one can corner a market or build a monopoly, and work in areas of shortage earns more points per hour. The third layer is feedback: the entire system is transparent and open to review, and where the signals lead to unjust or unsustainable results, a correction loop kicks in that combines data and deliberation — continuous monitoring of scarcity and ecological strain on one side, ethical review on the other. What gets corrected are the limits, not individual prices by decree. This solution is an approximation, not a perfect calculation, and it presents itself as such. It accepts a degree of imprecision in allocation, because that is the price of avoiding both dead ends: the omniscient plan, which is impossible, and the unfettered market, which becomes unjust. The nature of the value point ensures that even where a price remains imprecise, no lever for accumulation and power can arise from it, because it cannot be hoarded, cannot be speculated with, and is tied to real contribution.

INNOVATION WITHOUT THE BARRIER OF CAPITAL

Research and development must not founder for lack of capital. Central funds provide infrastructure, materials, and teams; personal effort is rewarded with value points; and ideas and inventions remain freely accessible, while the inventor receives recognition and a return in value points. A scientist who develops a new recycling process draws resources from the fund, their team is supported, and they are honoured for their contribution — without the invention being locked away behind a patent that denies the public access.

THE INTERFACE WITH THE OUTSIDE WORLD

SOLIS does not exist in isolation and therefore needs regulated crossings to the world of conventional currencies. A border exchange allows value points to be exchanged for foreign currencies. Yet so that the core property of the value point — no accumulation, no speculation — is not undermined from outside, this border is a controlled membrane, not an open gate for arbitrage. Exchange by individuals is limited: it covers legitimate external needs such as travel or imports, but does not

allow points to be siphoned off into wealth abroad. Large-scale outflows that would turn value points into foreign capital and re-import power through it are visible and capped. A buffer fund keeps the exchange rate within a stable band and protects against external shocks and speculation. A company that exports technology receives value points that can be exchanged at the border within these rules. The whole purpose of the border is to protect the internal order against the detour through foreign currency: the membrane lets value pass for real needs and seals the leak through which someone could escape the rule against accumulation.

TRANSPARENCY AND SECURITY

All transfers run through community banks, which serve not profit but secure settlement, transparency, and protection against misuse. The data sit on a tamper-proof infrastructure, personal privacy remains protected, and society sees only aggregate figures. In this way, the economic order ends dependence on money while keeping the benefits of regulated markets: no one need fear being unable to meet their basic needs; no one can establish a monopoly over air, water, or food; and no innovation fails any longer for lack of capital. Entitlements for survival and value points for shaping one's life — that is where the balance, the trust, and the stability of this order lie.

Old-Age Security

How a society treats old age shows whether it values its people or abandons them. In many existing systems, provision for old age is shaped by fear — the fear of not having enough in old age, of ending up poor after a lifetime of work, or of becoming a burden on the community. Traditional pension systems are under pressure from demographic change, uncertain funding, and the failure to recognize a lifetime's contribution fairly. SOLIS, by contrast, guarantees dignity in old age not as charity but as a right: no one falls below a defined level of dignity, those who have contributed receive demonstrably more, and the system stays stable even as demographics shift.

This security rests on three pillars. The first is a basic pension which, through the entitlements to housing, energy, health care, and food, secures a dignified life for everyone, regardless of their employment

history. The second is earned points, which arise from work, care, raising children, and voluntary service. The third is a productive fund — a collective, broadly diversified fund invested in the real economy and infrastructure, whose returns flow to older people as value points. Because security never rests on a single source, it holds even when one source weakens. What matters is that a lifetime's contribution counts in every form. Caring for relatives and raising children are fully credited, not as a gap in one's CV but as a valuable contribution, so that a mother who spends years raising children builds up points just as someone in paid work does. A qualification-and-shortage factor gives extra weight to especially needed work, while a cap protects against self-exploitation. A sustainability factor gently evens out demographic swings: the basic pension is funded from the community budget, earned points run through an active pay-as-you-go mechanism, and the productive fund is broadly diversified and invested counter-cyclically.

The system is also flexible and humane. A gradual transition into retirement, say between the ages of 62 and 70, allows for individual paths with a fairness factor; those who want to work longer are rewarded for it, and those who have to stop earlier do not fall into the void. In the event of reduced earning capacity, notional credits provide security, and surviving dependants are protected by the transfer of fund shares. The transition from the existing system is designed fairly as well: acquired entitlements are converted, a long period with both systems in parallel ensures a gentle changeover, and older cohorts receive guaranteed minimums. SOLIS thus takes the fear out of old age — no poverty in old age after a lifetime of work, no penalty for caring and raising children, no collapse through demographic imbalance.

Security and Planetary Defence

Throughout history, armed power has always been double-edged: it has offered protection and brought destruction, secured stability and stirred up fear, defended peoples and unleashed wars. In traditional systems, the military often serves national interests — projecting power, securing resources, gaining geopolitical influence — and so leads to wars of aggression, arms races, and oppression at home. SOLIS sees defence not

as an instrument of attack or expansion, but purely as a structure that protects people, infrastructure, and the planet.

The doctrine is strictly defensive. Defence protects the population from attack, secures critical infrastructure and data, and preserves ecosystems and resources; an attack on the power grid, for example, is repelled through cyber defence without SOLIS itself escalating militarily. The system is organized in tiers — cyber and information, air and space, land and sea defence, and civil protection — whose specialized forces act together in coordination. Civil protection is integrated with the military structures, so that dedicated units can respond flexibly to natural disasters, pandemics, technological accidents, and threats from space: after an earthquake they support evacuations, provide emergency power, and secure medical care; and an asteroid detected early is deflected while civil protection prepares evacuations in parallel.

Above all stand ethics and oversight. There are no offensive missions and no autonomous weapon systems without human control; an artificial intelligence may analyse threats but may not make a lethal decision without human authorization. The military leadership is always under civilian control and thus, like every form of power in SOLIS, under the oversight of the Ring and subject to the law. To prevent misuse, escalation follows a clear, public model that runs from the normal state through heightened vigilance and partial mobilization to full mobilization; each stage comes with clearly defined powers, and every escalation is followed by a duty to de-escalate. Internationally, SOLIS pursues a balance of caution through shared early-warning systems, arms control, and emergency protocols between states. In this way, it frees defence from the logic of attack and power projection: no arms race, no war of aggression, no deployment against its own population — only the protection of people and the planet.

Value Creation, Innovation, and Work

In most of today's systems, work is closely tied to fear — the fear of not earning enough, of not being needed, of falling behind, or of becoming ill and burnt out and therefore worthless. We have built societies in which work is above all a means of survival, and the result is people who stay in jobs they do not care for, creativity that suffocates under

daily drudgery, and innovations that lie fallow because they do not pay off in the short term. SOLIS understands work differently: not as a necessity for survival, but as an expression of creativity, contribution, and meaning.

Because the foundations of life are guaranteed in SOLIS, no one has to work in order to survive. This does not lead to no one working any more, but to the opposite: people get involved because they see meaning in it, want to contribute, and want to grow. A young mother teaches part-time because she enjoys passing on knowledge, not out of fear of otherwise losing her security; an older engineer works on a sustainable energy innovation because he wants to do something meaningful, not because he is worried about the rent.

Technology serves to relieve people, not to replace them. Routine tasks, as well as dangerous or physically heavy work, are automated, so that people can focus on what machines cannot do: creativity, empathy, strategic thinking, complex problem-solving, and social and emotional work. Innovation is fostered as a collective good; public funds and support systems, networks of mentors and experts, and accessible innovation spaces are open to everyone, not only to large corporations or privileged elites — so that, for instance, a schoolchild with an idea for plastic-free packaging can get into an innovation centre without depending on wealthy parents or investors.

Companies continue to exist, because they are important drivers of dynamism, efficiency, and specialization. Yet their success is no longer measured by profit alone, but equally by economic stability, social contribution, ecological sustainability, and ethical responsibility, and a public, transparent rating system makes these dimensions visible. A company that pays fair wages, uses environmentally sound materials, and strengthens local communities is therefore rated higher than one that only cuts costs. The aim is an economy that does not move numbers around but creates real value — for the people who work in it, for the communities it serves, for the nature it uses and protects, and for the future it helps to shape. The point is not to maximize growth for its own sake, but to let the right things grow: health, education, creativity, sustainability, and justice.

Distributive Justice

Almost every political debate talks about justice, and yet everyone means something different by it — some absolute equality, others absolute freedom, still others a fair balance. In SOLIS, distributive justice does not mean that everyone receives exactly the same. It means three things: that everyone has enough for a dignified, secure, and fulfilled life; that those who put in particular effort may enjoy more, as long as they do not live at others' expense; and that extreme inequalities that split society are actively prevented. This path follows from a twofold insight: radical equality often stifles achievement and innovation; radical inequality poisons societies, destroys trust, and breeds violence. The foundation is that no one has to fear for their bare survival. Access to food, clean water, medical care, secure housing, education, and participation is guaranteed — not as charity but as a basic right — so that a single mother does not have to worry about whether she can feed and provide for her children, and an old person does not fall into nothingness. This is the condition for every further freedom, because someone struggling to survive cannot think freely, be creative, or develop.

Above this foundation, SOLIS recognizes that people differ in talent, drive, and ability, and those who contribute a great deal, take on responsibility, or drive innovation may also enjoy more. The only thing that matters is that this does not rest on exploitation: you may be wealthy because you have created something, not because you have oppressed or cheated others. What is rewarded, then, is the scientist with a medical breakthrough, the entrepreneur who creates fair jobs and sustainable products, and the artist who enriches the culture — but not the speculator who makes money from money without creating value, the corporation that offloads environmental damage onto the public, or the elite that defines itself solely through power and exclusivity.

So that the extremes do not arise in the first place, SOLIS builds in balancing mechanisms. Progressive taxation asks those who have more for a proportionally higher contribution — not as a punishment, but in recognition that wealth always also rests on the community: on its infrastructure, its education and health systems, and its stability. The money raised does not disappear into opaque coffers, but is invested visibly and verifiably in education, health, innovation, and community.

Innovation bonuses give those who contribute ideas of long-term social benefit not only recognition but also the means to realize them. The order thus combines the security people need to live free of fear with the dynamism societies need to move forward. The point is not to demonize wealth, but to tie it to responsibility and to prevent extreme poverty, because poverty paralyses not only those affected but society as a whole. Where people experience the system as fair, trust grows — and trust is the glue without which the economy, politics, and community fall apart.

Sustainability and the Circular Economy

The conventional economy follows a destructive pattern: take, use, throw away. Raw materials are extracted, turned into products, consumed, and finally disposed of as waste. This linear system has left behind exhausted soils, polluted seas, toxic landfills, and destroyed ecosystems, and it has accelerated climate change. SOLIS breaks with this logic and builds an economy that does not merely destroy less, but actively regenerates and heals — cycles instead of lines, partnership instead of exploitation, long-term viability instead of short-term gain. In a circular economy, resources are not used up but kept in circulation. Materials are used for as long as possible, reused, and recycled to a high standard; by-products serve as inputs for other processes; waste counts not as rubbish but as a resource. A discarded device casing is not incinerated but taken apart, cleaned, and turned into new products, and industries are linked so that the residues of one become the raw materials of another. This goes beyond recycling; it is a system designed for circulation from the start.

Energy comes almost entirely from renewable sources — sun, wind, water, and geothermal heat — and SOLIS also invests specifically in advanced technologies such as fusion energy, highly efficient storage, and smart grids that balance fluctuations and optimize energy flows, so that fossil fuels are replaced completely. Products are durable, repairable, modular, and recyclable; planned obsolescence is abolished. A device has standardized modules, so that when the battery weakens, only the battery is replaced and not the whole device, and at the end of its life the individual parts return to the cycle. Agriculture, forestry, and fishing also work with nature rather than against it: soils are regenerated

through crop rotation, building up humus, and agroforestry; forests are managed sustainably; and fish stocks are used only to the extent that they remain stable in the long term.

SOLIS thus goes beyond merely reducing harm and aims at active healing — at reforestation that restores entire ecosystems, at the renaturation of rivers, and at processes that not only avoid carbon emissions but remove carbon from the atmosphere and return it to the soil. In this way, the order breaks with the idea that the economy is a zero-sum game in which nature loses whatever the economy gains. In its place comes a system in which prosperity and the protection of nature go hand in hand, in which innovation builds up rather than destroys, and in which cities can, in the long run, produce more energy than they consume.

Technology and Automation

Since time immemorial, human beings have built tools to help them, from the hand axe to the quantum computer. Yet every tool raises a question: who is serving whom? Does technology free us or make us dependent, does it create prosperity or deepen inequality, does it make work easier or strip it of meaning? SOLIS faces these questions and uses technology deliberately as a tool for relief, improvement, and healing — not as an uncontrolled force that replaces, manipulates, or dominates people.

Automation is used where it relieves, not where it destroys. It reduces physical strain, takes over monotonous routine, and improves quality and safety, creating room for creativity, empathy, and innovation. In agriculture, automated systems support precision irrigation and soil analysis, while designing crop plans and caring for ecosystems remain in human hands; in care work, machines take over heavy lifting and monitoring, while attention, conversation, and warmth remain the preserve of human beings. So that automation does not cause mass unemployment, SOLIS funds further training, retraining, and the development of talent, and guides people specifically into fields where their abilities are needed.

Powerful emerging technologies — artificial intelligence, robotics, biotechnology — are ethically examined and actively steered. Every new technology is assessed not only for its economic benefit, but for

its social, ecological, and psychological consequences; techniques such as gene editing, quantum computing, or neural interfaces are not left to market forces alone, but accompanied by ethical guidelines and public debate; and dedicated institutions — technology councils, ethics centres, and citizens' forums — help decide what is developed, what is rolled out, and what must be stopped or changed. An artificial intelligence used in health care must therefore be not only reliable but also able to explain how it reaches its decisions; it remains understandable and is not a black box.

Above all stands a clear basic stance: technology should make people stronger, freer, and more creative, not weaker, more dependent, and more uniform. Human beings remain sovereign. Machines do not steer people; people steer machines. Algorithms do not write the laws; people write algorithms that respect the laws. And biotechnology does not determine the future of our species; human beings decide which interventions are ethically justifiable. What we decide in the coming decades will help determine whether humanity slides into a world of surveillance and dehumanization or rises into a world of possibility and new forms of meaning. SOLIS takes the helm: it uses technology without letting itself be used by it.

Global Economic Cooperation

We live in a world bound together by the economy; no country and no region stands alone any more. Raw materials, goods, data, and ideas flow across borders, and that can be a blessing or a curse. So far the curse has prevailed: free trade that maximizes profits but destroys local communities; global supply chains built on exploitation and environmental destruction; and geopolitical power games in which the economy is misused as a means of pressure. SOLIS also thinks about the economy globally — but not as plunder; rather as a cooperative network that benefits everyone and not only the strongest.

Trade relations rest on fairness, sustainability, and respect. Agreements are not power games between industrial giants, but arrangements based on clear ethical principles: fair pay, ecological responsibility, respect for cultural differences, and long-term partnership instead of short-term extraction. A corporation from a rich country may therefore

not simply extract cheap raw materials from a poorer one without compensating local communities and meeting ecological standards; contracts must disclose how investment is made on the ground, which standards apply, and how both sides benefit.

Emerging and developing countries are strengthened rather than kept dependent. Instead of aid that entrenches dependency, there are transfers of technology and knowledge, fair financing for infrastructure that builds local resilience, and partnerships between equals in which local voices have a say. A country can thus develop its own sustainable energy systems with the support of global networks, but without binding contracts that plunge it into endless debt. Problems that cannot be solved nationally — climate change, pandemics, the loss of biodiversity, space research, global data flows, migration — are treated as a shared task of humanity and are financed, researched, and tackled cooperatively, with the knowledge gained shared openly rather than kept within closed elites. To make this work, SOLIS relies on concrete mechanisms: open, transparent trading platforms on which contracts and results can be inspected and conflicts of interest are disclosed; global ethics councils for economic questions that do not merely advise on large projects and agreements but oversee them; and multilateral innovation funds to which all contribute according to their economic strength and whose results are shared worldwide. The aim is neither self-sufficiency and isolation nor a world dictatorship, but a networked world economy in which cooperation is stronger than competition, rules apply to everyone and not only to the weak, and innovation is understood as a shared treasure. The world is too tightly interwoven and too vulnerable to carry on with the old patterns; the great challenges can only be met together.

CAPITAL ALLOCATION AS A NETWORK

This is where a question of power lies hidden that no economic order may overlook. The value point is pure circulation: it flows, but it does not accumulate. This banishes accumulation as a source of private supremacy — yet accumulation has not vanished; it has moved. Great undertakings require great resources, and the decision about which undertaking receives them is the most consequential economic decision of all. That decision now lies with the funds. So that no new summit arises here, the allocation of capital is not placed in one pair of hands but

spread across a network: many funds side by side — regional, sectoral, and citizen-led — each built on the model of the order of power, partly chosen by lot, rotating, and accountable. What matters is that there are many routes: anyone who wants to realize an idea can turn to several independent funds, so that a no is never the system's no, but only that of one door. A fixed share of the resources is always reserved for dissenters who challenge the prevailing consensus. In this way, the force that builds the future stays distributed and does not become a throne.

SAVING WITHOUT DOMINATION

That value points cannot be hoarded is aimed at oligarchy, not at provision for the future. There is a difference, which the order respects, between accumulation that turns into power over others and moderate saving for one's own plans. Value points therefore remain available for personal purposes over appropriate periods; their ceiling and expiry take effect only above the threshold at which savings would become a lever over other people's lives. The medium thus prevents domination without taking away the individual's ability to plan.

WORK AND CONTRIBUTION

In an economy where machines and artificial intelligence take over more and more of the necessary work, an old question arises anew: what do people work for, and by what measure is a life successful? SOLIS separates contribution from compulsion. The foundations of life are secured without having to be earned; work is thus no longer the way to escape the struggle for survival, but a way of contributing something and finding oneself in what one does. What automation takes away in toil, it gives back in time — for care, education, creation, and community. And the measure of success shifts: the successful person is not the richest, but the one who creates something lasting for the community. The dignity of work depends not on what it yields, but on what it means.

CHAPTER

06

Planet, Ecology, and Regeneration

OF THE FIVE FOUNDATIONS, RESPONSIBILITY FOR THE PLANET IS ONE OF THE LOAD-BEARING PILLARS, AND YET UNTIL NOW IT HAS HAD NO CHAPTER OF ITS OWN; IT WAS SCATTERED ACROSS THE ECONOMY, TECHNOLOGY, AND EVERYDAY LIFE. This chapter brings it together. For an order that aims to carry humanity beyond this generation depends on a condition that no majority can suspend: a living planet. On a ruined Earth, the question of the best order no longer arises.

THE PLANETARY BOUNDARIES

The starting point is an insight that comes before politics because it comes from physics: the planet has limits. Science calls them the planetary boundaries — the stability of the climate, the diversity of life, the purity of water, air, and soil — and beyond these limits the system that sustains all life tips over. SOLIS therefore treats them as what they are: a wall within which all economic activity and all freedom have their space. Ecological costs are built into every price by rule, so that doing harm costs more than sparing; the limits of extraction are not left to the market but set and monitored. Once something has been recognized as a limit of survival, no boom can lift it again.

REGENERATION, NOT MERE PRESERVATION

Where too much has already been destroyed, protection is no longer enough. SOLIS therefore goes beyond preservation to restoration: not only doing less harm, but actively healing. Forests are not only kept but brought back; soils are not only spared but built up; waters are not only polluted less but restored to life. The measure of success thus shifts from the least harm to the greatest recovery. A generation that gives the planet back more than it takes reverses the direction in which humanity has long treated the living world.

THE CLOSED CYCLE

Nature knows no waste; what one creature excretes is another's food. SOLIS makes this principle the basic form of its economy. The straight line from extraction through use to rubbish is replaced by the closed cycle: products are designed so that their materials become raw materials again, repair comes before replacement, and reuse before consumption. Yet this circle does not merely go round and round. It keeps materials flowing and at the same time carries knowledge and prosperity upward. A cycle in matter, progress in the mind — that is the spiral in which a civilization can endure without consuming itself.

THE RIGHTS OF THE LIVING WORLD

SOLIS widens the circle of concern beyond human beings. An ecosystem, a river, a forest are not mere property and raw material; they carry a weight of their own that counts in decisions. Where far-reaching projects affect the living world, it is given a voice through appointed stewards who represent its interests, just as a guardian represents the interests of someone who cannot speak for themselves. And because the planet also belongs to future generations, every act of extraction is subject to the proviso that those who come after will still find it habitable. The ethics councils therefore explicitly examine projects against this twofold claim: that of the living world and that of the people still to come.

ENERGY AND THE LONG FUTURE

The material basis of a lasting civilization is energy that does not consume the planet. SOLIS therefore relies on renewable, decentralized, and resilient energy systems — not only because they protect the

climate, but because a distributed supply can absorb failures that would bring down a centralized one. If one part fails, the others carry the load; no single node holds society's supply in its hands. Here ecological necessity meets the logic of the whole work: no monopoly over a central resource, but a network whose strength lies in its distribution. Only on this basis — a recovering planet and energy that does not devour it — does the distant future this work speaks of become possible at all.

Education and Knowledge

Education as a Right and a Foundation

IN SOLIS, EDUCATION IS A FUNDAMENTAL HUMAN RIGHT, AS INDISPENSABLE AS WATER, FOOD, AND SECURITY — NOT A LUXURY, NOT A BUSINESS, AND NOT AN INSTRUMENT OF POWER. This commitment follows from the insight that education is far more than passing on knowledge. It means access to information, the capacity for reflection, the chance to develop oneself, and the key to self-determination, participation, and dignity. Without it, people remain dependent and vulnerable, poverty reproduces itself from generation to generation, and inequality is handed down. Whoever secures education secures all other rights along with it; whoever denies it takes away the foundation of people's freedom.

Access is free and barrier-free. Every person has a right to education from birth, because education does not begin at school but in the family and the community, and it does not end with a diploma but continues throughout life. An expectant mother has access to counselling and learning materials; a young person with a disability is given learning systems that build on their strengths and compensate for their obstacles; an older person can keep learning new languages, techniques, and subjects free of charge.

Because not everyone learns in the same way, the education system adapts. It takes different learning styles into account, respects cultural diversity, and sees disabilities not as deficits but as variations of human experience; digital platforms, shared learning spaces, and professional support ensure that content is prepared flexibly and tailored to particular needs. Artificial obstacles disappear. There are no fees that reserve education for the wealthy, no admission barriers that make opportunities depend on background and connections, and no discrimination that systematically disadvantages minorities. A highly gifted young woman from a poor household does not have to go into debt to study, and a worker who wants to change direction at fifty is not blocked by bureaucracy.

All this is carried by a publicly funded educational infrastructure of schools, libraries, learning centres, and digital platforms, because education counts as a collective gain and not as a commodity. Its content is scientifically grounded, ethically reflected, and presented pluralistically. This sets a limit from the outset, to which the following sections return: no indoctrination, no propaganda, and no dictate of “correct” opinions.

Lifelong Learning

In most of today’s societies, learning is organized as a closed phase of life: first school, then training, then working life — and after that, a person counts as finished. In a rapidly changing world, this idea is disastrous, because standing still means falling behind, and yesterday’s knowledge is not enough to solve tomorrow’s problems. SOLIS starts from the assumption that learning never stops — not because people should optimize themselves without pause, but because learning is part of being human, an expression of curiosity, growth, and connection.

Everyone therefore has lifelong access to a wide range of learning opportunities — formal institutions as well as informal formats and self-directed paths. A tradesperson who wants to train in sustainable architecture at forty finds open courses and mentors; someone returning after years away is offered programmes that bring them up to date. Learning here is neither a stigma nor a status symbol, but a natural part

of life, and no one is smiled at for still learning in old age, or excluded because their learning happens informally.

For this to be possible, the world of work has to encourage learning rather than penalize it. In many of today's jobs, further training is a private burden, with no time and no money for it; in SOLIS, employers are obliged to enable continuous learning, working hours are arranged so that there is room for phases of learning, and new roles and careers arise from lifelong development rather than from a one-off diploma. An experienced carer who wants to move into robotics is supported, not held back. Phases of learning are financially secured, so that no one has to go into debt for their education, and informal learning — projects, experience, contributions to the community — is recognized rather than measured against formal diplomas alone. The result is a society that stays curious at every age and grows wiser and more adaptable together.

Access to Knowledge and Transparency

In the information age, knowledge is more than power; it is the foundation of survival, innovation, and freedom. And yet in most of today's systems it is not free, but hidden behind paywalls, locked up in patents, hoarded in data monopolies, and exploited by governments and corporations alike. SOLIS treats knowledge as a common good — not out of romanticism but out of necessity, because a society that shares knowledge is more resilient, more innovative, and more just.

To this end, SOLIS maintains open, multilingual, and barrier-free knowledge systems that make scientific findings, technological developments, historical sources, and cultural works accessible, complemented by local knowledge centres, so that people without digital infrastructure also have access. A village community can thus draw on the same medical knowledge as a research laboratory, and a young person can use the teaching materials of the best universities. What was paid for by the public belongs to the public: the studies, data, and methods of publicly funded research are open to all, which multiplies innovation, avoids needless duplication, and builds trust.

Private innovation remains protected, but not at the expense of the public. SOLIS recognizes that innovations from the private sector are valuable and grants them protection; yet patents and licences may never

be designed in a way that endangers the common good, and in areas such as medicine, environmental technology, and basic provision, the public interest comes first. A company may patent an active ingredient, but in a global health crisis it must offer fair licensing models. Knowledge thus does not become a commodity but remains a vital resource open to all — an application of the same transparency that SOLIS demands of its own institutions.

Creativity and Critical Thinking

In many of today's education systems, the hidden message is that you should absorb what you are given and reproduce it correctly; what is rewarded is conformity, not deviation. In an increasingly complex world, that is not enough. A society needs people who see new paths, question old patterns, and look at problems from unfamiliar angles. SOLIS therefore understands education not as a warehouse of knowledge, but as a space for thinking and exploring, in which what matters is not only the what, but equally the how and the why.

From an early age, children therefore learn not only facts but methods: how to analyse a situation, recognize patterns and contradictions, ask precise questions, and distinguish superficial causes from deeper ones. A historical event is not simply tested but worked through — why it happened, which perspectives existed, what might have gone differently, and what parallels it has with the present. Creativity counts here not as decoration but as a core skill, in art and science as much as in the economy and everyday life: the ability to connect the unexpected, to tolerate uncertainty, and to try something new without fear of failure. An education system that works this way does not fill vessels but lights a fire; it allows students to challenge their teachers, lets projects fail and still be valuable, and measures not how much knowledge has been ticked off but whether students find their own solutions.

THE MATURITY TO QUESTION EVEN SOLIS

Here lies a commitment that is decisive for the whole work. Critical thinking that stops short of the existing order is not critical thinking, but its opposite. Education in SOLIS therefore explicitly teaches people to question every authority — including SOLIS itself, its institutions,

and its officeholders. It gives people not only the values of the order, but also the tools to judge whether the order lives up to those values, and to change or abolish it if it does not. This is precisely the strongest protection against any order hardening into dogma, and against the manipulation of the public sphere discussed in the section on the media: a population that has learned to check sources, compare perspectives, and question power cannot be dominated. SOLIS asks of its citizens not obedience but judgment — and in doing so accepts that it will be measured by that judgment and, if necessary, rejected.

Ethical Education

In an age in which technology, power, and knowledge create ever greater levers, it is not enough to treat ethics as a minor subject. Today, a single person can paralyse systems, alter genetic code, or influence the lives of millions through supply chains and data flows. If these levers are operated by people who think only of themselves, the result is injustice and destruction. SOLIS therefore makes ethical education not a special programme, but a foundation that runs through every field.

Ethical reflection is built into every discipline. In the natural sciences it concerns responsibility for the environment and for consequences; in economics, fairness and sustainability; in medicine, patients' rights and fair access; in technology, the question of misuse. Every subject includes reflection on responsibility, and every project thinks through its ethical consequences, not only its benefits. This education starts early: children learn to consider the consequences of their actions, to put themselves in others' shoes, and to take responsibility — by making rules together, resolving conflicts, and talking about real dilemmas. And it makes ethical discussion the normal case — in schools, the media, and neighbourhoods — because a healthy society does not shy away from questions such as what a good life is, what we owe future generations, and where freedom ends; it needs them.

EDUCATION, NOT CONDITIONING

This raises an objection that SOLIS takes seriously and does not gloss over. A society that raises its young in the values it lives by is always in danger of letting education slide into conditioning — of turning the

path to maturity into drilling for compliance. SOLIS refuses to take that step, because it would be exactly the authoritarian move the whole order is fighting against. The line runs at a single point: a society may educate its children in the values that sustain it, but only in a way that preserves their ability to examine and reject those values. Ethical education in SOLIS therefore does not implant fixed “correct” convictions, but develops independent moral judgment — the ability to measure even SOLIS against its own standards. Formation that leaves a person free is education; formation that binds them is indoctrination. Only the first is compatible with the foundations of this order.

Global Knowledge Networks

The great questions of this century — climate, energy, health, peace, technology — know no borders and demand global answers. Such answers emerge only when knowledge flows freely across countries, cultures, and disciplines. In SOLIS, schools, universities, and research centres are therefore not isolated islands but part of a global network that shares data and methods, runs joint projects, and forms communities of learners and teachers across borders. A school on one continent works with a school on another on a reforestation project, combining local knowledge of plants, climate data, and technology into a model that works in both regions.

In SOLIS, “global” does not mean “Western,” but diverse and mutually enriching. The knowledge that counts is not only that of the great universities, but also that of Indigenous communities about ecosystems, of craft traditions about sustainable production, and of artistic movements about expression and change. A clean drinking-water project can thus combine high technology, traditional methods, and clever design into a solution that is adapted to local conditions, applicable worldwide, and culturally respectful. In this way, people learn not only about other cultures but with them and from them, and the intercultural judgment grows that builds trust where others put up walls. Knowledge becomes a global web of lights that illuminate one another.

CHAPTER

08

Health and Well-being

Health Care for All

IN SOLIS, HEALTH IS NOT A MARKET PRODUCT BUT A RIGHT — A NON-NEGOTIABLE, NON-COMMERCIAL HUMAN RIGHT. In most of today's systems, by contrast, it is a risk and a cost factor, a playing field for insurers, industry, and politics: those with money get treatment; those with little get rationing and waiting lists; and those who are unlucky end up with nothing. SOLIS breaks with this logic. As set out in the economic order, health is one of the entitlements due to everyone, with nothing required in return.

Access is equal and of high quality for everyone, and it is meant to be humane and holistic. Holistic care does not just treat symptoms but seeks to understand their causes; it looks not only at the body but also at the psyche, the mind, and a person's surroundings. A worker with chronic back pain therefore receives not just a painkiller but access to physiotherapy, workplace prevention, and psychological support, because health is more than simply functioning. From the outset, this care includes prevention, mental health, and social support, because health depends not only on genes and lifestyle but also on security, community, and meaning; the health system therefore works hand in hand with social work, education, and neighbourhood networks.

All this is carried by public funding that ensures fairness and stability. Basic medical care is funded collectively and administered transparently, and it knows no two-tier medicine and no existential fear of a doctor's bill. Private providers may exist, for example for elective treatments or special services, but they may never undermine the basic system or create privileged parallel worlds, because the market ends where life begins. Health thus becomes a shared good and a reflection of a society's ethical condition.

Prevention instead of Repair

In most of today's health systems, the same pattern repeats itself: people live in unhealthy conditions, fall ill, and only then does the system react — late, expensively, and after the fact. It is like a fire brigade that turns out only once the house is already on fire, instead of making sure houses are built safely in the first place. SOLIS understands health not as a repair shop, but as an active, forward-looking process that starts where illness begins. Prevention here means more than urging people to live more healthily; it means shaping the entire environment so that health becomes the norm, and spotting problems early, before small ones become big ones. A young person who begins to withdraw finds connection early, before depressive patterns take hold; an employee under heavy strain is offered flexible arrangements in time, before she burns out. Health thus becomes a cross-cutting task that is not offloaded onto individuals but carried by society: urban planning creates green spaces, clean air, and safe routes; the world of work ensures healthy working hours and a say for employees; food systems make the healthy choice the affordable default; education teaches from an early age what strengthens body and mind; and leisure activities are low-threshold and open to all. Prevention thus becomes a natural part of everyday life — from straightforward check-ups and easily accessible counselling to exercise and nutrition programmes that suit people rather than lecturing them. A city like this makes movement a pleasure rather than a chore, offers healthy food in schools and workplaces, and leaves time for recovery; and companies benefit from healthy, motivated people instead of worn-out staff. Prevention saves not only money but suffering, and it makes a

system more flexible and more sustainable, because it spots trends early instead of chasing after disasters.

Mental Health

In many societies, mental health is considered a private matter, a stain better kept quiet — with the result of stigma, shame, isolation, and overflowing waiting lists. SOLIS turns this picture around: mental health is as central as physical health; it is a matter for society, not just for the individual; and it is not attended to only when someone breaks down, but considered and cared for from the start.

Everyone has a right to psychological support — without bureaucratic hurdles, ruinous costs, or months of waiting, and without fear of stigma. This includes comprehensive counselling and care, reliably available crisis support, and tiered support systems ranging from preventive counselling to intensive therapy, so that a young woman with early symptoms of anxiety gets help straight away and not only after months. Mental health is also not a matter for clinics alone, but a cross-cutting concern that is considered everywhere: in schools through programmes for resilience, mindfulness, and an open culture of conversation, as well as through trusted contact persons; in the world of work through mandatory stress prevention, flexible hours, and managers trained in their psychological responsibility; and in communities through neighbourhood centres and low-threshold points of contact.

All this requires a social climate of openness, in which people may say that they are not doing well and are not told to pull themselves together, but are listened to. For many of today's burdens — exhaustion, depression, loneliness, anxiety — are not individual weaknesses but systemic consequences of overload, isolation, and loss of meaning. An order that recognizes this and creates both preventive and healing structures gives people permission to be human, and at the same time saves the high costs that suppressed suffering brings later on.

Social Health and Community

When people talk about health, they think of the body and perhaps of the mind; yet there is a third, often invisible dimension: social health — how connected a person is with others. The research is unequivocal: loneli-

ness is as harmful as smoking, and people who are socially connected live longer and healthier lives. Community is not a pleasant extra but a basic biological, psychological, and cultural need, and SOLIS makes it a task of the system.

In SOLIS, community does not arise by chance but is deliberately shaped and protected. Architecture, urban planning, and public spaces are designed to make encounters and mutual support easy; clubs, networks, and low-threshold opportunities to meet are given space and support; and places such as parks, libraries, and community centres remain open and are not taken over by commerce. Loneliness counts not as a private misfortune but as a social problem that is tackled deliberately — by paying attention to where isolation arises, for instance among older people, single parents, or newcomers, and through programmes that foster connection. An older woman whose children live far away thus remains part of a web across generations, in which she contributes her experience and at the same time finds support.

This goes hand in hand with a different understanding of strength. Where many of today's societies teach that everyone should look out for themselves and never show weakness, SOLIS holds that true strength grows out of connection, compassion, and cooperation. Children therefore learn not only subject knowledge but emotional intelligence, teamwork, and how to take responsibility, and care work is not looked down on as inferior but held in high regard. A society that fosters community is more stable, more peaceful, and more creative, because people catch one another when they fall — and like every good order, it measures itself by how it treats the weakest, not by how brightly the strongest shine.

Digital Health Systems

The digitalization of medicine brings hope and fear at the same time: the hope of better diagnoses and easier access, the fear of data misuse and cold automation. SOLIS takes a clear path here that follows the principles of the whole order: technology is a tool in the service of human beings, not their master. It extends what people can do, but never replaces what only people can do — compassion, presence, and relationship.

Everyone has a digital health record that brings together all essential information, is securely encrypted and stored in a decentralized way, and can be accessed only with the person's consent; in an emergency, paramedics have limited access to the relevant data without seeing the entire profile. Control over the data thus lies, as the order demands throughout, with the person themselves and not with a private company exploiting it. Artificial intelligence supports the system at many levels — in evaluating test results, detecting rare diseases early, and making personalized recommendations — yet it is never the deciding authority. Human oversight is mandatory, decisions are not blindly automated, and patients have the right to understand, question, and reject a recommendation; a doctor reviews an AI's suggestion, discusses it, and explains the alternatives instead of simply following it. Telemedicine, mobile services, and wearable devices overcome geographical and financial barriers, so that people in remote regions also have access to modern care, and a chronically ill person, for instance, gets timely help through a connected device. In all of this, however, one limit holds: technology can explain, monitor, and optimize, but it cannot hold a hand, cannot comfort, and cannot understand what it means to be human. Digital systems are tools, not substitutes for people; they create time, reach, and precision, yet the heart of healing and care remains the human relationship.

Global Health Networks

There is a contradiction in today's world: diseases know no borders, but health systems very much do. When a virus breaks out, an environmental toxin is released, or a biotechnological danger looms, nations often react by closing themselves off, assigning blame, and pursuing national advantage — and that costs time, lives, and trust. SOLIS holds that health is always global, because what happens anywhere concerns everyone, and it builds structures that work across nations and beyond the profit motive.

These include internationally connected early-warning systems that pick up medical, ecological, and technological signals early and share them transparently, supported by local laboratories and sensors, by analyses that are always accompanied by human review, and by global

crisis teams that act quickly and in coordination. When a new fever appears in a remote region, it is neither covered up nor left to run its course; instead, a coordinated response of analysis, support, and action begins. Medical breakthroughs are not a geopolitical plaything here: research results are shared rather than hidden, medicines and vaccines are distributed according to need rather than market power, and patents protect innovation, but not at the expense of global health equity. A vaccine against a dangerous virus is therefore made available precisely where it is needed most.

In this order, it is not charity but rational necessity for wealthy countries to support the development of robust health systems in poorer ones, because a virus that spreads unchecked in one place spreads everywhere, and a weak system endangers not only the people there but all of humanity. Investment in local infrastructure, training, and decentralized production therefore secures supply for everyone. Every person thus has a better chance of staying healthy, wherever they were born, and the competition between states gives way to a common project — a community of shared fate that shares its knowledge and its resources as a matter of course.

THE WHOLE OF LIFE: OLD AGE AND FAREWELL

An order that takes human beings seriously accompanies them across the whole arc of their lives, right to the end. In SOLIS, old age is not a siding but a full stage of life: older people remain part of the community, their experience is needed, and caring for them is an honoured task that society carries together, not a burden to be hidden away. Those who depend on care receive it without losing their dignity. And because the end is part of life too, SOLIS gives dying a humane setting: no one should have to die alone, in avoidable pain, or in degrading conditions. Support at the end of life, the relief of suffering, and respect for the wishes of the dying belong to a health order that does not merely keep people alive, but lets them go with dignity.

Culture and Meaning

Culture as Living Heritage

IN A WORLD THAT IS BECOMING EVER FASTER AND MORE TECHNICAL, SOMETHING IS IN DANGER OF BEING LOST THAT LIES AT THE VERY CORE OF BEING HUMAN: culture. It is not mere entertainment or decoration, but the memory and inner compass of a society — what sustains people, tells them who they are and where they come from, and builds bridges between past, present, and future. SOLIS therefore recognizes culture as a fundamental dimension, not a side issue.

Every cultural heritage counts as valuable here, whether great or small, global or local. There are no important and unimportant cultures, no great and small narratives; an Indigenous story carries as much weight as a classical work, a regional dialect as much as a world language. Cultures may change, grow, and mix, and at the same time protect what is sacred to them: a community may decide for itself which of its traditions it shares and which it keeps, rather than surrendering them to outside access.

So that culture is not left to the market or to chance, there are active programmes for preserving, documenting, and nurturing it — archives that safeguard languages, stories, and works; support for those who create and pass on culture; and spaces in which cultural knowledge stays alive. A programme that brings younger and older people together, so

that the older generation can share its stories and knowledge, preserves culture not as nostalgia but as living community. For people need roots to find their bearings, and societies need culture to foster cohesion and to resist uprooting. Diversity here is not a problem but a source of richness.

Art, Music, and Literature

In many of today's societies, art has become a luxury good, a market commodity, or a prestige project. Yet it is far more: the language of the soul, the tool through which a society looks at itself, and a laboratory for new ideas and feelings. It links the individual and the community, reality and vision. SOLIS therefore makes art, music, and literature a load-bearing pillar.

Artistic creation is encouraged, not merely tolerated. Public programmes support artists in every discipline, regardless of market value and mass taste, and the experimental and the critical in particular are given room; a theatre group developing a play about social inequality is supported because it matters to society, not because it sells. Art here is not a spectator sport: children and adults alike are encouraged to create for themselves — to paint, make music, write, and act — without pressure to perform and without elitist hurdles, and older people bring in their stories, from which younger people learn.

Art is judged not by its market value, but by its expressive power, its sincerity, and the impulse it gives to society. Street art, digital art, and traditional forms are taken equally seriously, and those who take up social or ecological questions receive particular support. A young person who finds their form of expression in graffiti therefore gets not just a criminal charge, but walls, workshops, and guidance to make something of their energy. For art gives individuals a voice and works for society like an immune system: it senses where something is ailing, makes visible what lies beneath the surface, and builds bridges where words fail.

Spirituality and Philosophy

In many modern societies, the search for meaning is considered a private matter, religion something that does not belong in public space,

and philosophy the business of a few specialists. Yet human beings need more than food, housing, and technology; they need meaning, depth, and a sense of connection to the whole, and they need spaces in which to ask the big questions — who they are, what life means, and what we owe one another. SOLIS recognizes this dimension as fundamental and makes it part of the social order. Every form of spirituality is respected, as long as it does no harm to others. Religion, non-belief, and every other form of the search for meaning stand side by side as equals; no one is forced to believe anything, and no one may impose their beliefs on others. A religious woman can practise her rituals as freely as a monk meditates or a thinker argues in philosophical conversation, and the protection of this freedom ends only where discrimination or coercion begins. To this end there are public spaces for silence and reflection, open to everyone, as well as shared celebrations and days of remembrance that are tied to no religion but honour our common humanity.

Philosophy, finally, is not an elite project but a tool for everyone. Children learn early on to reflect on the good life, on justice, and on happiness, and adults find spaces for shared inquiry in which the point is not the one right answer but thinking itself. A society that allows such questions is more resilient and more empathetic, because it meets existential uncertainty with depth rather than distraction. This ties in directly with the maturity grounded in the chapter on education: meaning cannot be decreed, only found, and an order that takes this seriously invites reflection instead of steering it.

Rituals and Shared Experiences

In the modern world, much has become purely functional — work, consumption, even leisure — and there is often little room for shared experience, for moments that step outside the flow of everyday life. SOLIS recognizes this as a basic human need. Rituals are not mere folklore or religious tradition, but bridges: between people and generations, between human beings and nature, between the individual and the community.

In SOLIS, rituals are not prescribed but are free to develop. They grow out of people's needs and experiences and may change and reinvent themselves; there is room for traditional forms as well as new ones, such

as ecological or artistic rituals. A city develops a festival together with its citizens, in which art, music, nature, and community come together — not as an attraction for outsiders but as an expression of a living identity. Such rituals can be religious or cultural, social or ecological, and they create moments of pause, connection, and meaning.

In a world that is often restless and fragmented, they are the moments that remind us that we belong together and share something greater. They are not just a programme but meaning that is lived, and they strengthen the community because they show that it is more than the sum of its parts. To make this work, communities receive the means to cultivate and develop their own rituals, and participation remains open to all, regardless of background, belief, or status.

Creating Meaning and Personal Fulfilment

In many modern societies, work counts as a way of earning money, success as career and possessions, and relationships as a private matter. In all this, a crucial question goes unanswered: why do we do what we do, and what truly fulfils us? SOLIS puts this question at the centre, because a good society is not only efficient and prosperous, but a space in which people can find meaning — not prescribed and not uniform, but personal and alive. In SOLIS, it goes without saying that people may ask themselves what is meaningful to them, where they want to make a difference, and how they can be part of something greater without losing themselves. Children are encouraged to be curious and to try things out; young people are supported in discovering their calling, guided not by income alone but by passion and contribution; and adults have the right to change direction when their path no longer fits, so that an engineer who longs to do social work can retrain without fear of losing status. Life here is not divided into useful and superfluous areas: work should not only function but provide meaning, and a contribution such as volunteering with children is valued, even when it does not primarily create economic value.

To this end, there are services that help people find their own sense of purpose — counselling, mentoring, and spaces for reflection; communities that support people through transitions; and an education that includes not only subject knowledge but personal development. This is

more than a soft concern: a person without meaning becomes empty and alienated inside, and a society full of alienated people is sick, however brightly its façade may shine. Every person has a right to a life worth living — not merely to survive, but to live.

Global Cultural Exchange

The present is marked by two opposing movements: on one side, cultures are becoming ever more interconnected; on the other, fears of appropriation, loss of identity, and cultural swamping are growing. This breeds uncertainty and mistrust, and living exchange often gives way to withdrawal and recrimination. SOLIS takes a different path and understands global cultural exchange not as a superficial ornament but as a necessity in a tightly interwoven world.

Exchange is therefore actively encouraged — through partnerships between schools and cultural centres, through collaboration between artists across borders, and through festivals and platforms that connect not only elites but also local initiatives. A music festival does not simply put people from different continents on stage one after another, but lets them create something together that none of them could have invented alone. The question of cultural appropriation is neither condemned wholesale nor carelessly brushed aside, but handled with awareness and dialogue: where does a form come from, what does it mean, and who has access to it? Marginalized groups can protect their forms of expression, and cultures may share what they wish to share and draw boundaries where they wish. Anyone who wants to work with the patterns of a community therefore enters into an exchange with it as a partner, rather than simply copying it.

In this way, diversity is understood as a treasure, not a threat. People discover new perspectives and forms of expression, which broadens horizons and strengthens empathy; societies that live exchange are more resilient and more creative; and in an interconnected world, the great challenges can only be met together. Instead of barricading themselves behind walls, people come together in open squares and let art, music, and ideas flow — as the shared treasure of humanity.

Culture and Identity

Culture gives meaning, creates identity, and connects generations, yet it can also divide when it is co-opted, and serve propaganda when it submits to power or the market. In many of today's systems it becomes either a commodity or a tool of ideology, and loses its free, connecting character in the process. SOLIS understands culture as free, diverse, and at the same time shared — as an expression of individual creativity and a foundation of social cohesion. The first consequence is the freedom of culture. Art, language, religion, and tradition are freely chosen; no one is forced to give up their cultural identity; and culture may be critical and challenge authority — including the order itself, in keeping with the maturity grounded in the chapter on education. An artist may therefore create political art without fear of censorship or commercial pressure, and a community may cultivate its traditions, as long as it respects the immovable threshold of fundamental rights. So that culture belongs to everyone and not to a few, it remains a common good: museums, libraries, theatres, and digital archives are open to all, education carries diversity forward, and cultural work is supported by funds rather than subjected to market pressure, so that a young musician can find support without becoming dependent on commercial structures.

Finally, identity in SOLIS is multidimensional and fluid, not one-dimensional and decreed. A person can see themselves as part of their region, their profession, and the world all at once, without these levels coming into conflict, and identity may grow rather than being fixed from above. Culture thus becomes a bridge that builds trust and shared values, enables dialogue between generations and groups, and offers orientation especially in times of change. Diversity is a strength here, as long as it is not artificially misused to divide — culture is free and not for sale; identity grows and is not decreed.

Technology, Artificial Intelligence, and the Future

Futures Research and Scenario Planning

NEVER BEFORE HAVE HUMANITY'S OWN ACTIONS SHAPED ITS FUTURE SO DEEPLY, SO QUICKLY, AND SO IRREVERSIBLY AS TODAY. A changing climate, artificial intelligence, biotechnology, the opening up of space, and shifts in the geopolitical balance are shaping a future that can no longer be left to chance. SOLIS concludes from this that a good society does not merely look into the future, but shapes it deliberately, ethically, and with preparation.

To this end, SOLIS maintains dedicated institutions that continually think ahead — institutes and research alliances that analyse technological, social, and ecological developments and draw up concrete scenarios from them: What happens when artificial intelligence reaches a new stage? What would far-reaching automation mean? In this work, science, business, and civil society come together, so that the best minds think ahead jointly. What matters is that this futures research does not happen in secret. There are no shadow circles that decide everything in advance; scenarios and analyses are made publicly available, taken up by schools and the media, and fed into citizen participation, so that society as a whole thinks along and sets priorities.

From this follows the principle that technology is not fate. It is not an unstoppable current that sweeps us along, but a tool whose use we decide. New technologies are therefore assessed not only technically, but also ethically, socially, and ecologically, and the public debate takes place before a development gets out of control, not only afterwards. The great upheavals are thus not simply endured but actively shaped — not out of fear of the future, but out of responsible foresight.

Artificial Intelligence and Humanity

Artificial intelligence is not an ordinary tool. It can learn and optimize itself, it may become independent, and it could be more powerful than any human institution. Traditional systems either see it purely as a means of efficiency or fear it as a threat. SOLIS takes a third path: artificial intelligence can be a partner in humanity's development, yet it may never dominate, replace, or disempower human beings; it should support and strengthen them.

Clear ethical limits apply. Artificial intelligence may take over tasks that are too complex, too dangerous, or too monotonous for people, but never final responsibility for life, dignity, and freedom; it may not wage war on its own, manipulate anyone without their knowledge, or replace any human relationship. An artificial intelligence in a hospital can therefore allocate beds and resources optimally, but it does not decide on its own about a life-saving treatment; that decision remains human. Particularly powerful systems are subject to strict, shared, and international oversight and are never controlled by individuals, corporations, or single states alone — a direct application of the order of power, which allows no summit and no monopoly over a central resource.

Wherever artificial intelligence acts in public domains — administration, education, health, or justice — it must be able to explain its decisions. There may be no black box whose logic no one understands; those affected have a right to see, to receive an explanation, and to appeal, and independent bodies review the systems regularly. In this way, the separation of knowledge from decision is preserved, and human beings keep the last word. Above all this stands a broad public debate about how far artificial intelligence may go and what makes us human —

held not only in expert bodies but across society as a whole, so that the most powerful tool in history does not become the master of its creators.

Transhumanism and Consciousness

The history of humanity is a history of extension — from the tool that lengthens the hand to the computer that speeds up thought. But now we have reached a new point, at which technologies no longer change only what we use, but what we are: neural interfaces, implants, genetic interventions, assistive systems closely bound up with our bodies. SOLIS faces this future neither naively nor fanatically, but in the knowledge that it is both an opportunity and a risk and demands the utmost care.

Technologies that extend body and mind are therefore subject to strict ethical scrutiny — without a blanket ban, but also without naive enthusiasm. Every new possibility is examined in many dimensions, technical and medical as well as ethical, social, and philosophical, and may be introduced only if it guarantees safety, respects dignity and identity, and preserves fairness in society. An implant that restores sight to a blind person is supported; an intervention that would give a wealthy minority cognitive superiority is restrained, because it entrenches inequality. It follows directly that there may be no pressure to enhance and no two-tier society: participation, dignity, and rights never depend on technical enhancements; anyone who does not want to be enhanced remains a full member of the community; and no job and no opportunity may be tied to an implant. This is where the absolute floor of fundamental rights takes effect: dignity comes before any optimization.

Because these questions touch on how people understand themselves, their relationships, and their mortality, every shift of the boundary is accompanied by philosophical and ethical reflection. Research into whether consciousness can be digitized or extended is not dogmatically forbidden either, but is pursued with the utmost respect for identity and meaning and bound by clear limits that prevent misuse and alienation. The question of whether we should do something is always taken as seriously here as the question of whether we can. In this way, humanity can grow at this threshold without losing itself.

Space Research and Interplanetary Ethics

For thousands of years, human beings have looked up at the stars with longing, and today that gaze is no longer a dream: lunar bases are being planned, missions to Mars prepared, and the mining of asteroids developed. This raises the question of how humanity will handle this new stage. SOLIS gives a clear answer: space does not belong to individual nations or corporations, but is a shared heritage and an extended living space for all of humanity. Research in space is therefore international, cooperative, and peaceful. Major undertakings are joint missions involving many countries and disciplines, not geopolitical races; scientific exchange and open innovation come first; and any military use of space is ruled out without exception. Mining is permitted only under clear ecological, ethical, and fair rules: environmental consequences are examined and minimized, the proceeds benefit all of humanity through shared funds rather than private investors alone, and international institutions handle approval and oversight. A consortium that wants to mine an asteroid must therefore show that there is no ecological risk and that part of the profits flows back into common goods.

Space is not only a store of raw materials but a possible living space and perhaps home to other forms of life. From the outset, SOLIS therefore considers how to deal with possible extraterrestrial life, how to prevent organisms from being carried across in either direction, and how to keep participation fair. Ethicists and philosophers also work in the research teams, there are clear protocols for dealing with the unknown, and humanity appears as a united civilization rather than a quarrelling mass of competing groups. It goes into space not as a ruthless conqueror, but as a learning and responsible species.

Risk and Disaster Management

A society that builds only on good times builds on sand. Natural disasters, global crises, technological dangers, and threats from space are part of the reality of an interconnected and technically complex civilization. SOLIS does not accept this fatalistically but responds actively: risks can never be avoided entirely, yet we can prepare for them and build systems that are robust, able to learn, and adaptable.

This includes structures that continually monitor and assess risks — cross-disciplinary teams from science, technology, and medicine; early-warning systems that analyse large amounts of data in real time; and systematic scenario planning that is not an exercise in fear but the basis for targeted preparation. When such a system spots an unusual threat early, assessments are drawn up within hours, emergency plans are activated, and resources are redirected. Disaster protection here is not national self-interest but a shared project: early-warning systems are linked internationally, emergency plans exist at every level, and aid networks are prepared, trained, and funded before an emergency occurs. If a solar storm threatens the power grid, for example, a decentralized energy supply absorbs the outage, and communication channels with multiple backups keep people connected.

Resilience, however, is more than technology. It is social, psychological, and ecological at once: strong communities and neighbourhoods, informed and level-headed people, and landscapes and cities that can cushion crises. After a disaster, people can therefore rely not only on material help but on community structures that provide psychological support. People thus experience themselves not as helpless victims but as responsible members of a resilient society that emerges from strain all the stronger — true to the resilience that is one of the foundations of this order.

Humanity's Place in the Cosmos

Beyond all technology and all systems lies not only the question of what we can do, but the greater question of who we are and who we want to be — for ourselves, for one another, and for the universe. SOLIS answers it not with arrogance but with humility. We are not the lords of the universe and not the crown of creation, but part of an immeasurably vast and still largely unknown whole. And it is precisely from this insight that a great responsibility grows. In the old logic, whatever we could take belonged to us, and the stronger decided. SOLIS reverses this logic. Where we use resources beyond Earth, we do so as careful stewards and not as blind exploiters; where we encounter alien life, we come not as conquerors but as mindful partners; and where we explore the cosmos, we do so aware of how fragile all life is. Our significance is measured

not by power but by responsibility, not by what we take but by what we contribute. Technological progress and expansion make sense only when they go hand in hand with inner growth — with wisdom, empathy, and mindfulness. SOLIS therefore measures greatness not by expansion but by maturity. We do not settle worlds merely because we can, but first ask what for; we develop technology that extends not only our reach but also our capacity for reflection; and we build a culture that stands out not for its size but for its depth. The great aim is not faster, higher, mightier, richer. It is to become a civilization that gives the cosmos more than it takes from it — one that carries culture, beauty, and knowledge outward, that learns instead of merely conquering, and that leaves traces that shine not only technically but morally. Perhaps we are the first known species that can consciously decide how it will conduct itself in the universe. That is a chance we should not waste.

Technology and Digitalization

The digital world is the nervous system of modern society; almost everything today runs through networks, data, and algorithms — communication, the economy, knowledge, and power. In many of today's systems, this nervous system is dominated by private interests: a few corporations control the platforms, data are exploited like raw materials, and algorithms invisibly decide what we see and think. SOLIS, by contrast, understands the digital order as public infrastructure, not private property: it serves people, not the other way round.

The basic digital infrastructure is therefore a common good. Networks, data spaces, and core technologies are open to everyone, are not dominated by monopolies but publicly managed and secured, and access is a right, not a privilege — so that someone in a remote region receives the same basic digital provision as someone in a big city. This goes hand in hand with control over one's own data: every person decides for themselves who may use their data; there is no secret exploitation and no trade in private information; and anyone who uses an application stays in control and can see and revoke at any time what happens with their data. Data serve people, not their manipulation. Where artificial intelligence operates in the digital sphere, what was set out in the section on artificial intelligence applies: it remains an adviser and does

not become a ruler, final responsibility remains human, and its systems are explainable and bound to the basic values. Added to this is digital transparency: public data platforms make projects and decisions traceable, algorithms that affect the common good are disclosed and open to review, and control lies with society rather than behind closed doors — so that, for instance, any citizen can follow how a public procurement procedure reaches its decision. The digital nervous system is thus freed from private domination: no exploitation of data, no invisible steering, no technology that rules over people. The digital belongs to everyone, data belong to the individual, and technology serves people, not power.

THE HUMAN ABOVE THE MACHINE

That humans keep the last word is easy to state as a principle and hard to secure in practice. An artificial intelligence far superior to humans can control them without ever giving an order — by pre-sorting the situation, selecting the options, and preparing the decision so that in the end all that is left is a nod. SOLIS counters this quiet capture with firm safeguards. For every far-reaching decision, the system does not present a single recommendation as if there were no alternative, but several genuinely different paths together with their trade-offs; a justification that a layperson can check takes the place of blind trust; and review systems appointed for this purpose have the task of arguing against the obvious recommendation. Above all, framing the question remains reserved for humans — deciding what is up for choice and what counts as success. The machine illuminates the answer; the human asks the question.

ASYMMETRIC TRANSPARENCY

The openness on which this order rests carries a danger of its own. The same infrastructure of data and sensors that makes power transparent could also expose the citizen; pointed in the wrong direction, transparency would become a panopticon. SOLIS therefore deliberately reverses its direction: full visibility falls on power — on offices, funds, and algorithms — while the life of the individual is protected by privacy. Privacy is a right, data minimization a rule, and every person remains in control of the data that concern them. Whoever exercises power over others becomes visible; whoever simply lives their life remains private.

Children and Families

Birth and Early Childhood

WHEN A CHILD COMES INTO THE WORLD, IT IS NOT ONLY A BIOLOGICAL EVENT BUT AN ACT OF HOPE, A MOMENT IN WHICH A SOCIETY RENEWS ITSELF, AND AN INVITATION TO EVERYONE TO TAKE RESPONSIBILITY. SOLIS therefore sees birth not as a purely private matter but as a shared task: every child is valuable, not only to its family but to the whole of society.

From the outset, every expectant mother receives high-quality medical, psychological, and social support — prenatal care, help during birth, and aftercare — regardless of income, status, or place of residence, carried by a culture of care in which women are safe and respected. Because children are not raised by mothers alone, all caregivers are included: fathers, co-parents, grandparents, siblings, and chosen families receive advice and support, and the diversity of family forms is recognized. A father does not just get parental leave on paper, but a whole network of support so that he can be truly present at the start of family life.

Early childcare here is a place of loving care and not mere supervision. Small groups, trained professionals, and spaces for play, creativity, and bonding replace rigid timetables, and there is no pressure for early schooling, only activities geared to the child. Because parenthood is often exhausting and lonely, no one is left to cope alone: family centres

and midwifery services are fixed points of support, neighbourhood initiatives organize mutual help, and financial and bureaucratic hurdles are deliberately removed, so that a young mother on a low income can also accept support without shame. There are deep reasons for this: the first years of life shape the brain, the body, and the emotions; people who feel supported make better parents; and every child who is raised well is a gain for everyone. A society that surrounds even a person's first breath with dignity and community shows that its members stand up for one another.

Education and Care

Children are born learners; they ask why before they can talk, and they discover, explore, and play not because they are made to, but because it is their nature. SOLIS shapes education so that this innate joy in learning is not lost but preserved and strengthened. Where today's school systems try to take all children through the same content at the same pace to the same exams — overwhelming some and under-challenging others — children here learn individually: at their own pace, following their own interests, and building on their own strengths. A child who is fascinated by nature can research and experiment; a child who loves numbers gets extra challenges without being labelled; a child who blossoms in art is supported as a full member of the community and not treated as second-rate.

In this kind of education, mistakes are not a stain but a sign of where there is still something to discover; instead of fear of bad marks and a division into clever and stupid, children are encouraged to try another way, to reflect, and to grow. Teachers are not just transmitters of subject matter but companions and mentors who open up paths of learning and support emotional, social, and creative development — which means less teaching from the front and more shared projects and relationship work. Creativity, cooperation, and social intelligence stand as equals alongside the traditional subjects: art is not a minor subject, teamwork is a key skill, and practising empathy counts as much as factual knowledge.

A single project shows how closely all this fits together. When children build a tree house together, they combine the mathematics

of statics and measurement, the biology of suitable trees and nature conservation, the language of documentation, the design sense of art, and the ethics of cooperation and responsibility into living, practical learning that has nothing to do with memorizing isolated facts for a test. An education like this sees the child as a whole person and produces the creative, reflective, and courageous people who can shape change. Above all, however, it ties in with the maturity grounded in the chapter on education: from the very beginning it nurtures independent thinking and the ability to question, instead of drilling compliance — because the challenges of this century cannot be solved with the schools of the century before last.

Family Structures

The family is one of humanity's oldest and most powerful social structures, yet it is not a rigid model; it changes with time, culture, and living conditions. SOLIS therefore understands the family not as a fixed template but as a living, flexible, and loving network, and it strengthens every kind of family bond that is carried by care, responsibility, and devotion, whatever it looks like.

This removes the invisible norm that, in many of today's systems, treats only one family form as normal and merely tolerates all others. Same-sex parents, blended families, single parents, chosen families without biological ties, and multigenerational households are recognized as equally valuable, as long as they are based on care and mutual respect; there is no discrimination in rights and benefits, no moral judgment from outside, and no ranking of traditional over modern. At the centre stands not society's idea of morality but the well-being of the child: support, education, health care, and childcare are geared to what children and their caregivers actually need, not to whether they fit a particular model. A single father has the same rights as a couple, a same-sex couple exercises parenthood jointly without bureaucratic hurdles, and a chosen family of friends raising a child counts as a family in the full sense.

So that families really have time for one another, working life is organized differently. Flexible part-time work, job sharing, a sensible amount of working from home, parental leave for both parents, and

support for family carers are not a luxury but a cornerstone of a healthy society; a father can take several months of parental leave without putting his career at risk, and grandparents who spend a lot of time with their grandchildren are recognized as part of the family network. The family is thus relieved rather than overburdened; it is not a private building site that collapses under growing pressure, but something valued and supported by society as a whole. Care and child-rearing are culturally upgraded and recognized as a valuable achievement, not a private sacrifice — and a society that invests in its families builds cohesion, resilience, and emotional health in the long run.

Safe Spaces and Emotional Development

Children need more than education, food, and a roof over their heads; they need emotional security — spaces in which they can make mistakes, learn to trust, express their feelings, and develop resilience. In SOLIS, emotional health is therefore not a side issue but a central goal. This includes stable, reliable adults whom children can turn to with their worries, without first having to make an appointment or go through official channels. Trusted teachers who are visible and approachable, key carers in day nurseries, and neighbourhood centres with open doors give children the certainty that someone is listening and takes them seriously, which reduces fear and helplessness and builds courage and self-confidence. On top of this come programmes for resilience, mindfulness, and empathy that are a firm part of everyday life, because emotional strength is not innate but grows when it is nurtured. Children learn early on to recognize and manage their feelings, to put themselves in other people's shoes, and to disagree fairly, and they learn that setbacks are part of life and how to deal with them in a healthy way.

Because the digital world is both a playground and a risk for children, media literacy is taught early. A child learns not only how to use a device but also how social media work, how to tell real information from manipulation, and that likes are no measure of their own worth — a direct continuation of the maturity grounded elsewhere in this work. If a child nevertheless becomes the target of bullying, it is not left alone: support structures step in early, and instead of mere punishment there is

real relationship work that strengthens the child affected, while recognizing that the child doing the bullying often needs support too — the same restorative spirit that shapes the legal system. SOLIS thus takes the heart as seriously as the mind, because emotionally strong children become reflective and empathetic adults who sustain a healthy society.

Youth, Identity, and Self-Discovery

Youth is a phase like no other. Body and mind change rapidly, and questions come to the fore that were barely there before — who you are, where you belong, what you want to do with your life, and what freedom, responsibility, and meaning really mean. In many societies, this time is seen as a problem phase, and young people are treated as a nuisance or a risk to be controlled. SOLIS, by contrast, sees youth not as a threat but as a valuable time of transition — of searching, trying things out, and growing — that deserves particular attention.

Young people need spaces in which they can discover themselves without being judged or punished straight away, and SOLIS creates them: creative workshops, sports facilities, youth centres, digital platforms, and political and social participation projects. A youth centre therefore offers not just a pool table but workshops for music, environmental projects, start-up ideas, philosophy, and theatre, where young people find out, with peers and adults, what really moves them. They are supported in finding themselves without pressure and without being put down: young people have the right to question, to doubt, and to reinvent themselves, and mentoring, counselling, and peer networks aim to strengthen identity rather than break it — in a climate of trust, respect, and freedom.

This is also the time when sensitive questions come up, for example about sexuality, gender identity, belief, and political views. In SOLIS, these questions may be asked and discussed openly, and young people are given the chance to find their own voice in a safe and respectful setting with competent support. The point is not to steer them in a pre-determined direction, but to help them find their own — entirely in the spirit of the maturity and of the multidimensional, fluid understanding of identity developed earlier in this work. This matters, because self-confident young people with good support have better chances of a

fulfilled life, and a society that strengthens its young people gains creativity, innovation, and stability. Children and young people are not only future adults; they are already full members of the community with their own rights, needs, and dreams — and an order that recognizes this moves forward together with them.

Implementation and Transition

The Path from What Exists to SOLIS

AN ORDER LIKE SOLIS CANNOT BE SWITCHED ON OVERNIGHT. A society cannot be reprogrammed in a day, fears and obstacles cannot simply be argued away, and — this is crucial — such an order cannot be imposed by force either, without betraying its own foundations. An order built on dignity and maturity cannot be installed through a coup; it has to be won through persuasion and through successful example. SOLIS is therefore a long, deliberate process of transformation that takes time, patience, courage, and a culture of learning from mistakes. This path runs through three phases that interlock. It begins with a change of consciousness, because before structures change, minds and hearts have to move: honest assessments that show not only problems but also possibilities, and courageous voices in the media, art, science, and everyday life who dare to ask whether we really want to carry on like this. Next comes the building of beacons — concrete places and projects that show it can be done: cities that switch to a circular economy, companies that work according to these principles, schools and research networks that try out new approaches. Such examples inspire, prove that change is practice and not just theory, and build momentum. Only when enough people are convinced and enough examples hold up does systemic change begin — new legal frameworks, new economic

incentives, new institutions — and this too happens not overnight but step by step, with setbacks, accompanied by monitoring and correction. The transition to SOLIS is therefore a project spanning generations, perhaps the greatest humanity has ever undertaken.

AN HONEST ASSESSMENT

Two things need to be said clearly here. First, this transition comes with no guarantee, and it will meet not only inertia but real resistance. Second, and harder: SOLIS redistributes power and wealth, and those who hold both in concentrated form under the existing order — together with the institutions built to protect them — will not be moved by arguments, because what is at stake for them is not understanding but interest. A design that assumes the powerful can be persuaded is naive, and SOLIS makes no such assumption. It renounces coercion, but not realism — and how it deals with this resistance without betraying itself is the subject of the section on actors and resistance.

Stages of the Transformation

The transformation to SOLIS is not a sudden upheaval but a relay race in which the stages build on and reinforce one another. The order is not arbitrary; it follows an inner logic. It begins with education, because without the ability to think in complex terms, reflect ethically, and act creatively, every later reform comes to nothing. This education starts not at university but in early childhood, and it prepares people to shape change in the first place. Next comes the economy as the most powerful lever: incentives shift from short-term gain towards sustainable, socially and ecologically meaningful activity, and a new corporate culture — participation, ethical goals for innovation, responsibility towards society and the planet — takes the place of pure profit logic. Once the economy changes, governance must follow, so that political and institutional structures carry the change: more transparency, more ethical oversight, more participation, and, step by step, the bodies of the order of power described in this work take shape. In parallel, work is done on the soft factors — on values, stories, and how we understand success, happiness, and meaning — because the successful person in SOLIS is not the richest but the one who creates something lasting for

the community. In the end, a local process becomes a global one that learns from itself, respects differences, and shares common principles.

For this to succeed, it needs strategic roadmaps that set out stages, priorities, and responsibilities; accompanying education and culture programmes that make people participants rather than mere bystanders; pilot projects with clear strategies for spreading what works; and global platforms for sharing knowledge and resources. Transformation thus becomes not chaos but a deliberate process carried by many.

Actors, Roles, and Resistance

The change to SOLIS does not happen by itself; it is carried by people. Three roles are central. The pioneers are the courageous first movers who try out new ideas, often against the current and at their own risk — social entrepreneurs, municipalities, teachers, and artists who live out what is at first only theory, and so build momentum. The bridge-builders are less visible and yet indispensable: they bring together what would otherwise stay apart — citizens and politics, science and business, young and old — translating between worlds and creating spaces in which people with different interests work on solutions together. Finally, the guardians watch over ethics and law: ethics councils, ombudspersons, and platforms for whistle-blowers ensure that the change does not proceed blindly or recklessly, protect the weaker, and hold SOLIS to its own standards.

NOT ALL RESISTANCE IS ALIKE

Wherever there is movement, there is resistance, but it is not all of one kind. Some resistance is a legitimate signal: it shows where people are afraid, where there are real conflicts of interest, or where someone has been overlooked. When a pilot project for sustainable urban development meets protest because rents are rising, that is no reason to abandon it but a sign that mechanisms for social balance are missing; such resistance is listened to and turned into better solutions. Other resistance, however, is not a signal for improvement but the defence of privilege by those who stand to lose power and wealth, and it does not dissolve through dialogue, because it does not rest on a misunderstanding. Treating both kinds alike is the naivety on which great designs

have foundered. SOLIS distinguishes between them and meets each in its own way.

BUILDING IN PARALLEL INSTEAD OF ASKING PERMISSION

Because the powerful will not give up their power, SOLIS does not wait for their consent. Its strategy is not to conquer the existing centres of power, but to build parallel structures that simply work better — cooperative enterprises, provision from common goods, deliberative bodies, open knowledge networks, and resilient, broadly based supply chains — and to let them grow until they overtake and absorb the old structures. The transition is thus won less through conquest than by making the old order obsolete: where the new order simply serves people better, the old one loses its grip. This is not a detour but the actual path, because it needs none of the coercion that SOLIS rejects, and it bases the new order on what it achieves rather than on what it conquers.

THE DANGERS, NAMED PLAINLY

This path can fail, and naming the dangers is itself a protection against them. The first is capture: the new institutions being taken over by the very interests they were meant to replace. The order of power, selection by lot, rotation, and the right of recall work against this by making lasting takeover mechanically difficult. The second is economic strangulation: an island of SOLIS, surrounded by a hostile market, being starved out or undercut. The controlled border membrane and the building of resilient, networked, and cooperative structures, rather than isolated experiments, work against this. The third is hollowing-out: the language of SOLIS being adopted while its substance is emptied. Measurable monitoring of fundamental rights and the maturity of citizens, which allows hollowing-out to be recognized, work against this. The fourth is relapse: the order eroding over time. Deep civic education and the structural impossibility of entrenchment work against this. A society that keeps these dangers in view is far harder to defeat by them.

NO COERCION, BUT DEFENCE

Finally, there is a distinction on which everything depends. SOLIS renounces attack and any attempt to establish itself by force; it is not installed through an overthrow and does not compel the unwilling. Yet renouncing coercion does not mean renouncing defence. A society that

has built something just is not obliged to let it be destroyed, sabotaged, or hijacked in the name of tolerance. The line runs as in the chapter on security: attack is forbidden, defence is legitimate. SOLIS protects what it builds against those who want to tear it down — without itself becoming the aggressor it rejects.

Communication and Persuasion

No idea, however good, survives without communication, because people need to understand what it is about, feel that it concerns them, and see that they can take part. In SOLIS, communication is therefore not an add-on or a PR machine, but the heart of the transformation: it connects, explains, inspires, and mobilizes.

Above all, it explains not only what is happening but why. Too often today, reforms are pushed through and laws passed without people understanding the reasons, which breeds mistrust and withdrawal. SOLIS therefore always answers the questions of purpose and meaning as well: when a city switches to renewable energy, it communicates not only the technical details but also why the change is necessary, what it means in the long run, and what role each individual plays. This communication is aimed at everyone, not only at elites — at the factory worker, the young person, the pensioner, and the single parent as much as at the entrepreneur — in clear, respectful language without technocratic jargon, and it uses every channel, from traditional media and digital platforms to local events and the arts. Change in a city therefore does not begin with an administrative decree alone, but just as much with a festival of music, conversation, and shared experience.

Finally, what matters is that communication is a dialogue and does not run from the top down. The point is not to broadcast messages, but to create spaces in which questions can be asked, doubts voiced, and proposals made, and in which those responsible talk with the population rather than about it. A new law is therefore not only explained; there is also an open phase in which citizens ask questions, help shape it, and raise concerns. The result is a society that does not merely endure change but carries it together.

International Spread and Adaptation

SOLIS is not a finished template to be laid over the world, because every society has its own history, its own symbols, and its own resources, strengths, and wounds. It therefore sees itself not as an export product but as an open, adaptable model: it offers core principles and an ethical framework, while the concrete form emerges locally.

The core principles are the same everywhere. Human dignity, sustainability, justice, participation, and innovation that serves the common good apply in Brazil as in Finland, in Ghana as in Japan; they form the ethical backbone that is not up for negotiation. What differs is the how. Which institutions are built, which paths are chosen, and which symbols and rituals carry the system depend on each society: in an Indigenous community, protecting traditional knowledge systems comes first; in a post-industrial metropolis, social and technical innovation; in a region scarred by war, building resilience before complex structures of governance can emerge. Every society thus fills the framework with its own reality, instead of having a foreign model imposed on it.

So that SOLIS does not break up into isolated islands, international networks connect the individual paths. Through them, knowledge is shared — which approaches have worked, where there were setbacks, and what can be learned from them; resources are distributed so that poorer regions receive the same opportunities; and standards are coordinated, so that basic ecological and human-rights principles apply everywhere, even where they are implemented differently. A network of SOLIS communities on every continent exchanges ideas, runs joint projects, and shares experience without flattening local differences. For the great challenges — climate, pandemics, the loss of biodiversity, migration — can only be met together, and the diversity of paths is not a weakness here but a source of innovation and resilience. SOLIS therefore seeks neither self-sufficiency nor isolation, nor a world dictatorship, but a humanity that is united and at the same time diverse.

CHAPTER

13

World Order: SOLIS Among the Peoples

THE GREATEST DANGERS OF OUR AGE RESPECT NO BORDERS. A changing climate, a new pandemic, a runaway technology, a threat from space — they strike humanity as a whole, and no single country can avert them. An order designed only for the inside would therefore remain incomplete. This chapter asks how SOLIS relates to the world: how many societies can act together without a new ruler rising above them, and how humanity can carry planetary tasks together without giving up its diversity.

THE RING AT THE PLANETARY LEVEL

The obvious answer to global problems would be a world government — and it would be the most dangerous summit of all. What holds for a single state holds all the more for the planet: wherever a highest authority arises, so does the ultimate target for capture, and distance would make it no safer than any throne before it. Here too, SOLIS chooses not the pyramid but nesting. The order is built in many layers, from the neighbourhood through the region to the planetary level, and each layer is itself a Ring: partly chosen by lot, rotating, subject to recall, transparent, and without a summit. Above this stands the principle of subsidiarity in its strict form: a higher level may do only what the lower level genuinely cannot. The planetary level is left with only what is truly

planetary; everything else belongs closer to the people. The result is global coordination, but no global ruler.

WHAT CAN ONLY SUCCEED TOGETHER

Some tasks, however, can only be solved by humanity as a whole. The climate respects no borders, a pathogen leaps every wall, a powerful artificial intelligence in a single pair of hands endangers everyone, and an asteroid does not distinguish between nations. For these few but decisive cases, SOLIS creates a Planetary Defence — shared early warning, shared capabilities, shared rules — which is itself bound into a ring and belongs to no single power. Protecting humanity from its own end is the one task that no sovereign may keep for itself, and at the same time the one that no power may use as a pretext for raising itself up. The Planetary Defence, too, is therefore subject to selection by lot, rotation, and accountability.

GLOBAL JUSTICE

A shared planet demands shared justice. The goods that belong to everyone — the atmosphere, the oceans, the heritage of space — may not be appropriated by a few; their yields benefit all of humanity, not only those who grab them first. Where wealth rests on past wrongs, making amends is part of justice — not as eternal guilt, but as an honest reckoning. And no society may build its prosperity on exploiting another. In SOLIS, diversity is a strength to learn from, not a pretext for a hierarchy among peoples.

BELONGING AND MIGRATION

Who belongs to a community, and how one joins or leaves it, touches the core of every order. SOLIS holds two things together here. On the one hand, the right to leave: no one is chained to an order, however just; anyone who wants to emigrate or found a different community of their own may do so, limited only by the rule that no one may leave in order to harm others or to destroy the common good. This is the controlled membrane applied to people: it lets legitimate difference pass and closes only the loophole through which someone would undermine the order from outside. On the other hand, the right to come: migration is treated not as a threat but as something to be managed humanely and in an orderly way, with responsibility both for those seeking protection and

for the communities that receive them. An order that people are free to leave has to convince them through what it achieves, not by bolting the exit.

SURVIVING IN A MIXED WORLD

SOLIS does not arise in an empty world, but alongside powers that do not share its principles. A society that binds itself ecologically and ethically while others do not can be overrun or undercut before its example takes effect. SOLIS responds neither by retreating nor by attacking, but by joining with others: alliances of like-minded regions, mutual defence, resilient and networked supply chains, shared knowledge. Its path outward is the same as its path inward — winning by making the old order obsolete: where the new order visibly serves people better, the old one loses its grip. Until then, SOLIS protects what it has built without itself becoming the aggressor.

A UNITED, NOT UNIFORM, HUMANITY

The goal is neither a world state nor a patchwork, but a humanity that is united without being uniform. The five foundations apply everywhere — dignity, balance, responsibility for the planet, the advancement of knowledge and wisdom, and long-term resilience; they are the common core that is not up for negotiation. Everything else may differ: the shape of institutions, the language of culture, the paths to meaning. Just as SOLIS does not prescribe a single idea of the good life, it holds firmly to what all human beings share. A narrow, firm core with a rich diversity above it — that is the order in which humanity can act as one without ceasing to be many.

Summary and Outlook

The Principles at a Glance

AT THE END OF THIS WORK, IT IS WORTH ASKING WHAT SOLIS ACTUALLY IS AND WHAT SETS IT APART FROM OTHER DESIGNS. The answer is this: SOLIS is not a rigid law, not an unchangeable manifesto, and not a finished model to be imposed on a society. It is a learning, evolving system — a framework, a stance, a compass that has to be brought to life anew in every society and every generation. For all its flexibility, however, it is held together by principles that run like a common thread through every domain and form its ethical backbone.

The first is the inviolability of human dignity, which demands not only that we harm no one, but that we actively ensure that every person can flourish. The second is the insight that freedom and responsibility belong together: freedom without responsibility is reckless, responsibility without freedom is oppression, and true freedom arises where people recognize their responsibility and live up to it out of conviction. The third is that technology is a tool and not an end in itself — it may go only as far as ethical guardrails allow, and it is not the machine but the human being who decides. The fourth is sustainability as respect for the world we share, which does not merely do less harm but actively restores. The fifth is participation as the glue of society, which does not merely consult people but takes them seriously and empowers them.

And the sixth is global solidarity, which sees diversity as a strength, learns from others, and takes on responsibility together.

These values would have remained without consequence, however, had the work not set institutions alongside them. The hardest question, the question of power, SOLIS answers not with a supreme body but with a ring without a summit, anchored in the people and protected against lasting capture by selection by lot, rotation, recall, and the separation of knowledge from decision. It does not abolish the economy, nor does it try to plan it with omniscience; instead, it sets boundaries for the market: basic provision as an entitlement, and discretionary goods through a medium of value that cannot be hoarded, whose prices emerge from decentralized signals within ecological and social limits. It protects the public sphere not through a ministry of truth, but through a procedure with a burden of proof, a right of appeal, and an immovable limit: it may never be used against criticism of SOLIS itself. And it educates its citizens not towards compliance but towards maturity — up to and including the ability to reject the order itself if it deserves to be rejected.

These principles and institutions do not stand side by side in isolation; they connect society, economy, education, culture, health, technology, and family into a networked whole. This is the essence of SOLIS: not a technocracy, not an ideology, and not a finished cure-all, but a living web of connections, carried by people who know that freedom, responsibility, dignity, and sustainability strengthen one another — an order with a clear compass that allows for mistakes, learns from them, and improves itself.

Why SOLIS Is Needed

One might ask why such a comprehensive design is needed, and why it would not be enough to repair the existing systems. The answer is that humanity stands at a crossroads whose significance exceeds anything that has come before, and that this crossroads opens up in several dimensions at once.

In the planetary dimension, we have for the first time the means to make the planet uninhabitable — and at the same time the technologies to heal it; the only question is which direction we choose, and mere repair is no longer enough. In the technological dimension, artificial

intelligence, biotechnology, and neurotechnology are growing exponentially and can connect us just as easily as they can divide us; what matters is who steers them and who sets the ethical limits. In the social dimension, we have the knowledge to feed everyone, to end poverty, and to make education available to all — and yet millions go hungry and inequality keeps growing, which raises the question of how long we intend to stand by instead of creating systems that put this knowledge to fair use. And in the psychological dimension, a world celebrates incredible progress while burning out on the inside; the question is whether we want societies in which people merely function, or societies in which they flourish.

This is not a scenario from the distant future; it is the present. We are already living in the middle of this ordeal — in a world that celebrates progress, entrenches injustice, is falling apart politically, stands at an ecological tipping point, and is exhausted in spirit. So this is not about small repairs or patching up systems that have long since reached their limits, but about a new architecture, a new foundation, a new social contract that reconnects human beings, the planet, technology, and meaning. In the end, nothing less is at stake than the question of how we as humanity can not only survive but flourish — how we can create a civilization that grows, learns, and heals, on this planet and beyond. Time is pressing, because every generation that hesitates shifts the responsibility onto one that may no longer have a choice.

The Great Vision

SOLIS is more than a reform plan, a political agenda, or an economic concept. It is a vision — a comprehensive vision greater than any ideology, any party programme, and any national interest. It sketches a world in which every child has the chance to discover their gifts, and no talent is lost just because it does not fit a standard; a world in which no one goes hungry while others live in abundance, because wealth means not isolation but shared responsibility; a world in which work brings fulfilment instead of exploitation, in which technology serves people and not the other way round, in which we cooperate with nature instead of fighting it, in which cultures dance with one another instead of waging war, and in which we look to the stars not as conquerors but as guardians

who are still learning. Some will object that this sounds beautiful but is unrealistic, that people are simply not like that. SOLIS replies that this vision is not a naive dream but a standard — not a finished goal but a guiding light by which systems, decisions, and structures can orient themselves. The point is not whether we create the perfect world, but whether we refuse to settle for less than the best we can be. Such a vision does three things at once: it gives hope, by showing that change is possible and the future can be shaped; it gives orientation, by helping to set priorities and weigh decisions; and it gives meaning, by answering why we take on the hard work of change — because we refuse to accept a world in which inequality, destruction, and cynicism are the norm. It thus stands like a guiding star over the whole, offering orientation even in dark moments and directing our gaze beyond the next election cycle to the generations still to come.

The Call to Humanity

This section is not an analysis and not a theory, but an appeal — to you, to me, to all of us. For it is not enough to wait for those at the top to fix things, to hope that politics and institutions will sort everything out, or to believe that a new strongman or a perfect programme will take care of it all for us. Nor is it enough to retreat into cynicism and hopelessness, to hide behind screens and irony, or to make ourselves small with the thought that one person cannot change anything anyway.

For society is not the government and not the system; society is all of us, with our everyday decisions, words, and actions. Each of us can try out new ways of doing things where we live — live more sustainably, act more fairly, speak more mindfully — connect with others and strengthen neighbourhoods and initiatives, start small projects, spark conversations, set a visible example, and pass on what we know. This needs no saviour and no great leader, only a critical mass of people who say: we want things to be different, we want them to be better, and we are starting here and now, with the means we have and in the lives we lead. SOLIS is not a project imposed from above, but a network and a field of possibilities in which every movement, however small, becomes part of a great change.

Imagine it: in one city, a school begins to change the food it serves, to give pupils more say, and to teach mindfulness; in one neighbourhood, people begin to generate energy together and to bring public spaces back to life; in one company, employees redesign their working hours and share the profits more fairly. None of these efforts changes the world on its own, yet together they form a web that grows ever denser and stronger. The call of SOLIS does not want to burden you; it wants to show you that you are part of something greater, that you have a voice, and that you are not powerless. The question is not whether you can change everything, but whether you are ready to play your part — with courage, with heart, and with hope.

A Closing Word

This work was not written for elites, academies, or conferences, and not for government papers that gather dust in drawers. It was written for the people who work, love, suffer, and hope every day — often quietly, often unseen, often exhausted — and who sometimes wonder whether that is all there is, or whether there is something greater out there calling them and connecting them with others. SOLIS is an invitation to everyone who senses that there is more in them than everyday life allows, and who has the courage to think big and start small.

So let this work be dedicated to those who are yet to come — may they grow up in a world that does not only protect them but nourishes and strengthens them; to the old, who have given us their stories — may we honour their wisdom and preserve their experience; and to the living, who waver between fear and hope — may they realize that they are not alone, and that their longing for meaning and connection is no accident but a calling. SOLIS does not want to be a dogma or a holy scripture, but a compass, a tool, a bridge, and a beginning; it invites us not to follow blindly, but to think, feel, and act along with it.

On paper, this book ends here. In truth, however, it does not end but begins — in minds, in hearts, in conversations, and in the actions that grow out of it. May SOLIS be a bridge and not a bunker, a light and not a watchtower of power, a promise and not a command. For the children, for the old, for us, for the Earth, for the stars, and for life.

System of Learning, Integrity and Sustainability — SOLIS.
